Risk Summary Tables Based on CTE Exposure Parameters

CDM Smith

Attachment H9.1. CTE and RME Risk Summary for Hypothetical Future Residential Exposures to Groundwater
700 S 1600 E PCE Plume Superfund Site, Salt Lake City, Utah

Receptor	Well	Risk Grouping [a]	Reasonable Maximum Exposure (RME)			Non-cancer Drivers [b] (Detects Only)	Cancer Risk Drivers [b] (Detects Only)	Central Tendancy Exposure (CTE)			Non-cancer Drivers [b] (Detects Only)	Cancer Risk Drivers [b] (Detects Only)
			HI_{child}	HI_{adult}	$Risk_{lifetime}$			HI_{child}	HI_{adult}	$Risk_{lifetime}$		
Residential	**MW-01D**	Based on Detects only	3E-01	2E-01	4E-06		Ingestion: BIS(2-ETHYLHEXYL)PHTHALATE	7E-02	5E-02	3E-07		
		Site-related only	4E-01	3E-01	1E-05		none [c]	7E-02	5E-02	8E-07		
Residential	**MW-03RB**	Based on Detects only	6E+00	5E+00	5E-05	Ingestion, Dermal, and Inhalation: **PCE**	Ingestion: CHLOROFORM; **PCE; TCE** Dermal: **PCE** Inhalation: BROMODICHLOROMETHANE; CHLOROFORM; **PCE; TCE**	1E+00	1E+00	2E-06		none
		Site-related only	6E+00	5E+00	3E-05			1E+00	1E+00	2E-06		
Residential	**MW-03RC**	Based on Detects only	2E-01	1E-01	9E-06		Inhalation: CHLOROFORM	4E-02	3E-02	2E-07		
		Site-related only	4E-01	3E-01	2E-06		none	6E-02	5E-02	1E-07		
Residential	**MW-03RD**	Based on Detects only	8E-03	6E-03	1E-06			1E-03	9E-04	4E-08		
		Site-related only	2E-01	2E-01	2E-06		none	3E-02	2E-02	1E-07		
Residential	**MW-08C**	Based on Detects only	6E-03	5E-03	1E-06			1E-03	7E-04	3E-08		
		Site-related only	2E-01	2E-01	2E-06		none	3E-02	2E-02	1E-07		
Residential	**MW-13L**	Based on Detects only	1E+00	1E+00	2E-05		Inhalation: CHLOROFORM; **PCE**	3E-01	2E-01	6E-07		
		Site-related only	1E+00	1E+00	6E-06			3E-01	2E-01	4E-07		
Residential	**MW-34C**	Based on Detects only	All ND	All ND	All ND			All ND	All ND	All ND		
		Site-related only	2E-01	2E-01	1E-06		none	3E-02	2E-02	1E-07		
Residential	**MW-34D**	Based on Detects only	All ND	All ND	All ND			All ND	All ND	All ND		
		Site-related only	2E-01	2E-01	2E-06		none	3E-02	2E-02	1E-07		

See Attachment H.5 for detailed risk estimates for each exposure pathway and COPC.

Cancer risk is within the USEPA acceptable risk range between 1E-06 and 1E-04

Non-cancer HI is greater than 1 or cancer risk is greater than 1E-04

Notes:

[a] Risk is presented based on detects only (i.e., includes only the detected COPCs) and for site-related COPCs only. The site-related COPCs include PCE, TCE, cis-1,2-DCE, vinyl chloride, and 1,4-dioxane. Risk for site-related COPCs includes both detects and non-detects.

[b] Chemicals are identified as drivers if the individual chemical-specific HQ is greater than 1 or risk is greater than 1E-06. The list of risk drivers is limited to only those chemicals that were detected in groundwater. Site-related risk drivers are shown in **bold**.

[c] 1,4-dioxane was not detected in groundwater, but the achieved detection limits were not adequate relative to a cancer risk threshold of 1E-06.

All ND = all COPCs were non-detect in all samples
cis-1,2-DCE = cis-1,2-Dichloroethene
COPC = chemicals of potential concern
HI = hazard index
HQ = hazard quotient
none = no individual chemicals had an non-cancer HQ greater than 1 or cancer risk greater than 1E-06
PCE = Tetrachloroethene
TCE = Trichloroethene

		Site-related only	1E-02	1E-02	2E-07			8E-03	7E-03	4E-08		

See **Attachment H.6** for detailed risk estimates for each COPC.

Cancer risk is within the USEPA acceptable risk range between 1E-06 and 1E-04
Non-cancer HI is greater than 1 or cancer risk is greater than 1E-04

Notes:
[a] Risk is presented based on detects only (i.e., includes only the detected COPCs) and for site-related COPCs only. The site-related COPCs include PCE, TCE, cis-1,2-DCE, vinyl chloride, and 1,4-dioxane. Risk for site-related COPCs includes both detects and non-detects.
[b] Chemicals are identified as drivers if the individual chemical-specific HQ is greater than 1 or risk is greater than 1E-06. The list of risk drivers is limited to only those chemicals that were detected in groundwater. Site-related risk drivers are shown in **bold**.
[c] For property 0040-H, interim measures have been taken; risk estimates are based on pre-mitigation conditions.
[d] For property 0051-H, interim measures were taken (i.e., basement cracks were sealed); risk estimates are based on pre-mitigation conditions. Post-mitigation conditions show no unacceptable risks.
[e] For property 0054-H, pressure cycling results indicate indoor sources were the primary contributors to overall exposures; the VI pathway is incomplete.
[f] For property 0059-H, risks are being driven by one historical sample collected within inches of a floor drain. If risk estimates were based on 2020 breathing zone samples, no unacceptable risks are present.
[g] For property 0197-H, interim measures were taken (i.e., portable air filters provided) while the TCE source was investigated further.

All ND = all COPCs were non-detect in all samples
cis-1,2-DCE = cis-1,2-Dichloroethene
COPC = chemicals of potential concern
HI = hazard index
HQ = hazard quotient
none = no individual chemicals had an non-cancer HQ greater than 1 or cancer risk greater than 1E-06
PCE = Tetrachloroethene
TCE = Trichloroethene

See **Attachment H.6** for detailed risk estimates for each COPC.

	Cancer risk is within the USEPA acceptable risk range between 1E-06 and 1E-04
	Non-cancer HI is greater than 1 or cancer risk is greater than 1E-04

Notes:

[a] Risk is presented based on detects only (i.e., includes only the detected COPCs) and for site-related COPCs only. The site-related COPCs include PCE, TCE, cis-1,2-DCE, vinyl chloride, and 1,4-dioxane. Risk for site-related COPCs includes both detects and non-detects.

[b] Chemicals are identified as drivers if the individual chemical-specific HQ is greater than 1 or risk is greater than 1E-06. The list of risk drivers is limited to only those chemicals that were detected in groundwater. Site-related risk drivers are shown in **bold**.

[c] For property 0040-H, interim measures have been taken; risk estimates are based on pre-mitigation conditions.

[d] For property 0051-H, interim measures were taken (i.e., basement cracks were sealed); risk estimates are based on pre-mitigation conditions. Post-mitigation conditions show no unacceptable risks.

[e] For property 0059-H, risks are being driven by one historical sample collected within inches of a floor drain. If risk estimates were based on 2020 breathing zone samples, no unacceptable risks are present.

All ND = all COPCs were non-detect in all samples
cis-1,2-DCE = cis-1,2-Dichloroethene
COPC = chemicals of potential concern
HI = hazard index
HQ = hazard quotient
none = no individual chemicals had an non-cancer HQ greater than 1 or cancer risk greater than 1E-06
PCE = Tetrachloroethene
TCE = Trichloroethene

		Site-related only	3E-02	2E-07			3E-02	5E-08		

See **Attachment H.6** for detailed risk estimates for each COPC.

Cancer risk is within the USEPA acceptable risk range between 1E-06 and 1E-04
Non-cancer HI is greater than 1 or cancer risk is greater than 1E-04

Notes:
[a] Risk is presented based on detects only (i.e., includes only the detected COPCs) and for site-related COPCs only. The site-related COPCs include PCE, TCE, cis-1,2-DCE, vinyl chloride, and 1,4-dioxane. Risk for site-related COPCs includes both detects and non-detects.
[b] Chemicals are identified as drivers if the individual chemical-specific HQ is greater than 1 or risk is greater than 1E-06. The list of risk drivers is limited to only those chemicals that were detected in groundwater. Site-related risk drivers are shown in **bold**.
[c] For property 0040-H, interim measures have been taken; risk estimates are based on pre-mitigation conditions.
[d] For property 0051-H, interim measures were taken (i.e., basement cracks were sealed); risk estimates are based on pre-mitigation conditions. Post-mitigation conditions show no unacceptable risks.
[e] For property 0054-H, pressure cycling results indicate indoor sources were the primary contributors to overall exposures; the VI pathway is incomplete.
[f] For property 0059-H, risks are being driven by one historical sample collected within inches of a floor drain. If risk estimates were based on 2020 breathing zone samples, no unacceptable risks are present.

All ND = all COPCs were non-detect in all samples
cis-1,2-DCE = cis-1,2-Dichloroethene
COPC = chemicals of potential concern
HI = hazard index
HQ = hazard quotient
none = no individual chemicals had an non-cancer HQ greater than 1 or cancer risk greater than 1E-06
PCE = Tetrachloroethene
TCE = Trichloroethene

[c] Indoor sources were present and removed from Building 6. If risk estimates were based on the most recent sampling (collected after sources were removed), no unacceptable risks are present.

All ND = all COPCs were non-detect in all samples
cis-1,2-DCE = cis-1,2-Dichloroethene
COPC = chemicals of potential concern
HI = hazard index
HQ = hazard quotient
none = no individual chemicals had an non-cancer HQ greater than 1 or cancer risk greater than 1E-06
PCE = Tetrachloroethene
TCE = Trichloroethene
VAMC = Veterans Affairs Medical Center

Attachment H.10

Correlations Between Media and Analytes

ATTACHMENT H.10 – CORRELATIONS BETWEEN MEDIA AND ANALYTES

To understand the potential relationships between the chemical concentrations in the different media types (indoor air, soil gas, and groundwater) and between different chemicals in the same medium, regressions between various combinations were considered. For example, if a positive relationship is observed between the concentrations for a given chemical in indoor air and soil gas or indoor air and groundwater, this would support the conclusion that this chemical in indoor air is influenced by vapor intrusion (VI). If a positive relationship is observed between two chemicals in the same medium, this could indicate the that both chemicals are derived from the same source. This correlation analysis focuses on the chemicals of potential concern (COPCs) for indoor air that were frequently identified as being risk drivers. The list of COPCs evaluated included PCE, TCE, 3-butadiene, 1,2-dichloroethane, benzene, chloroform, and ethylbenzene.

Correlations Between Media

For each location where samples of different media (i.e., indoor air, soil gas, groundwater) have been analyzed, the regression presents the maximum concentration across all samples of the respective analyte in the respective media. In the regression figures, the risk-based screening levels for each medium are shown for reference. For groundwater, the lower of the U.S. Environmental Protection Agency (EPA) residential tap water regional screening level (RSL) or the residential groundwater vapor intrusion screening level (VISL) is shown. For soil gas, the residential soil gas VISL is shown. For indoor air, the residential indoor air RSL is shown. All screening levels are based on a target hazard quotient of 1 or a target cancer risk of 1E-06. In the figures, the vertical green line indicates the residential screening level for the medium represented on the x-axis, and the horizontal yellow line indicates the residential screening level for the medium represented on the y-axis. Initially, regressions were evaluated on a site-wide basis (across all locations). As appropriate, subsets of locations, such as the subset of locations on the Veterans Affairs Medical Center (VAMC) campus, locations within Sunnyside Park, and/or locations within the East Side Springs (ESS) area, were evaluated to assess if there were differences in relationships as a function of distance from the source area.

The following bullets describe the relationships between media for each COPC.

- **PCE (Attachment Figure H.10-1).** There was no observable relationship between PCE concentrations in groundwater and soil gas (R^2=0.005, Panel A), soil gas and indoor air (R^2=0.001, Panel B), or groundwater and indoor air (R^2=0.002, Panel C). The lack of relationship between soil gas and indoor air held when confined to the ESS area only (R^2=0.001, Panel D).

- **TCE (Attachment Figure H.10-2).** A weakly negative relationship was observed between TCE in groundwater and soil gas (R^2=0.30, Panel A), but there was no relationship between soil gas and indoor air (R^2=0.03, Panel B). A weakly positive relationship was observed between groundwater and indoor air (R^2=0.18, Panel C), and no relationship was observed between soil gas and indoor air in the ESS area (R^2=0.01, Panel D).

- **Chloroform (Attachment Figure H.10-3).** There was a positive association between chloroform in groundwater and soil gas (R^2=0.62, Panel A). However, this relationship does not translate to indoor air, with no correlation observed between soil gas and indoor air (R^2=0.08,

Panel B) and a weak relationship between chloroform concentrations in groundwater and indoor air (R^2=0.39, Panel C).

- **Benzene (Attachment Figure H.10-4).** There were limited detections in collocated media available for determining relationships between benzene concentrations in groundwater, soil gas, and indoor air. While there was a weak correlation between groundwater and indoor air (R^2=0.51, Panel C), the regression for groundwater and soil gas showed no relationship (R^2=0.01, Panel A), or for soil gas and indoor air (R^2=0.06, Panel B), suggesting indoor air concentrations are driven by indoor sources and not groundwater impacts.

- **Ethylbenzene (Attachment Figure H.10-5).** Similar to benzene, there were limited detections in collocated media available for determining relationships between ethylbenzene concentrations in groundwater, soil gas, and indoor air. Only three paired data were available for soil gas and groundwater, resulting in an artificially high correlation (R^2=0.99, Panel A). More paired data was available for indoor air and soil gas, and groundwater and indoor air, but no apparent relationship existed between these media pairings (R^2=0.13, Panel B; and (R^2=0.28, Panel C, respectively), suggesting indoor air exposures are driven by indoor sources.

- **1,2-Dichloroethane.** Similar to benzene and ethylbenzene, there were limited detections in collocated media available for determining relationships between 1,2-dichloroethane in groundwater, soil gas, and indoor air. Notably, this analyte was not detected in any groundwater samples, and only four paired data were available for soil gas and indoor air (R^2=0.43, data not shown). The paucity of detections in groundwater and inverse relationship between soil gas and indoor air, suggest that exposures to 1,2-dichloroethane are attributable to indoor sources.

- **1,3-Butadiene**. 1,3-Butadiene is a non-soluble gas and was not analyzed in groundwater. No paired data were available for this analyte in indoor air and soil gas.

Correlations Between Analytes

Each sample is analyzed for multiple chemicals. The regression compares the reported concentration for each COPC for the same sample. In the regression figures, the risk-based screening levels for each medium are shown for reference. In the figures, the vertical green line indicates the residential screening level for the chemical represented on the x-axis, and the horizontal yellow line indicates the residential screening level for the chemical represented on the y-axis. Initially, regressions were evaluated on a site-wide basis (across all locations). As appropriate, subsets of locations (i.e., VAMC campus, Sunnyside Park, ESS area) were evaluated to assess if there were differences in relationships as a function of distance from the source area.

The following bullets describe the relationships between COPCs for each medium.

- **Indoor Air (Attachment Figure H.10-6).** PCE and TCE concentrations were weakly correlated in indoor air across the study area (R^2=0.18, Panel A). This lack of relationship holds when confined to the ESS area (R^2=0.22, Panel B). However, strong positive associations were observed between benzene and ethylbenzene (R^2=0.82, Panel C) and benzene and chloroform (R^2=0.85, Panel D) in indoor air; however, these relationships may be artificially inflated by

isolated high concentration data pairs. No strong associations were observed between any other combination of risk-driver COPCs in indoor air.

- **Soil Gas (Attachment Figure H.10-7).** There was a positive association between PCE and TCE (R^2=0.40, Panel A) in soil gas, regardless of location. The strength of the association is conserved for samples from the VAMC campus (R^2=0.39, Panel D), in the Sunnyside area (R^2=0.47, Panel C), and in the ESS area (R^2=0.42, Panel B). A weakly positive association between benzene and ethylbenzene was observed in soil gas (R^2=0.42, Panel E); however, no relationship was observed between chloroform and benzene in soil gas (which differs from what was observed in indoor air, [R^2=0.02, data not shown]). No strong associations were observed between any other combination of risk-driver COPCs in soil gas.

- **Groundwater (Attachment Figure H.10-8).** Relationships between PCE and TCE were strongly correlated for samples from the Sunnyside area (R^2=0.85, Panel C) and from the VAMC campus (R^2=0.72, Panel D); however, this relationship did not hold in the ESS area (R^2=0.067, Panel B), or the site-wide data set (R^2=0.0024, Panel A). Notably, for both the Sunnyside and VAMC campus data sets, these relationships may be artificially inflated by isolated high concentration detections. Regardless, the regressions suggest that the relationship between PCE and TCE in groundwater is more strongly correlated closer to the source area. As was observed for soil gas and indoor air, a strong positive association was observed between benzene and ethylbenzene in groundwater (R^2=0.96, Panel E), although the strength of this association may be artificially inflated by high concentration data pairs. No strong associations were observed between any other combination of risk-driver COPCs in groundwater.
