Methods and meterial for containment and cleaning up:	Eliminate all ignition sources if safe to do so. Take precautionary measures against static discharges. Stop leak if possible without any risk. Use only non-sparking tools. Absorb spill with vermiculite or other inert material, then place in a container for chemical waste. Clean surface thoroughly to remove residual contamination. Dike far ahead of larger spill for later recovery and disposal.
Notification Procedures:	Inform authorities if large amounts are involved.
Environmental Precautions:	Do not contaminate water sources or sewer. Prevent further leakage or spillage if safe to do so.

7. Handling and storage

Precautions for safe handling: DO NOT handle, store or open near an open flame, sources of heat or sources of ignition. Protect material from direct sunlight. Take precautionary measures against static discharges. Ground and bond container and receiving equipment. Use personal protective equipment as required. Do not get in eyes, on skin, on clothing. Use only with adequate ventilation. Wash hands thoroughly after handling. Do not handle until all safety precautions have been read and understood. Obtain special instructions before use.

Conditions for safe storage, including any incompatibilities: Keep away from food, drink and animal feeding stuffs. Keep container tightly closed in a cool, well-ventilated place. Ground container and transfer equipment to eliminate static electric sparks. Comply with all national, state, and local codes pertaining to the storage, handling, dispensing, and disposal of flammable liquids.

8. Exposure controls/personal protection

Control Parameters

Occupational Exposure Limits

Chemical Identity	type	Exposure Limit Values	Source
ACETONE	REL	250 ppm 590 mg/m3	US. NIOSH: Pocket Guide to Chemical Hazards (2010)
	PEL	1,000 ppm 2,400 mg/m3	US. OSHA Table Z-1 Limits for Air Contaminants (29 CFR 1910.1000) (02 2006)
	TWA	750 ppm 1,800 mg/m3	US. OSHA Table Z-1-A (29 CFR 1910.1000) (1989)
	STEL	1,000 ppm 2,400 mg/m3	US. OSHA Table Z-1-A (29 CFR 1910.1000) (1989)
	TWA	250 ppm	US. ACGIH Threshold Limit Values (03 2015)
	STEL	500 ppm	US. ACGIH Threshold Limit Values (03 2015)

Biological Limit Values

Chemical Identity	Exposure Limit Values	Source
ACETONE (acetone: Sampling time: End of shift.)	25 mg/l (Urine)	ACGIH BEL (03 2015)

Appropriate Engineering Controls No data available.

Individual protection measures, such as personal protective equipment

General information: Good general ventilation (typically 10 air changes per hour) should be used. Ventilation rates should be matched to conditions. If applicable, use process enclosures, local exhaust ventilation, or other engineering controls to maintain airborne levels below recommended exposure limits. If exposure limits have not been established, maintain airborne levels to an acceptable level. An eye wash and safety shower must be available in the immediate work area. Use explosion-proof ventilation equipment.

Eye/face protection: Wear safety glasses with side shields (or goggles) and a face shield.

Skin Protection

Hand Protection: Chemical resistant gloves

Other: Wear suitable protective clothing and gloves.

Respiratory Protection: In case of inadequate ventilation use suitable respirator. Chemical respirator with organic vapor cartridge.

Hygiene measures: Provide eyewash station and safety shower. Observe good industrial hygiene practices. Do not eat, drink or smoke when using the product. Wash hands before breaks and immediately after handling the product. Wash contaminated clothing before reuse. Do not get this material in contact with skin. Avoid contact with eyes. Do not handle until all safety precautions have been read and understood. Obtain special instructions before use.

9. Physical and chemical properties

Appearance

Physical state:	liquid
Form:	liquid
Color:	Colorless
Odor:	Sweet, mint-like
Odor threshold:	No data available.
pH:	No data available.
Melting point/freezing point:	-94.7 °C
Initial boiling point and boiling range:	56 °C (101.3 kPa)
Flash Point:	-20 °C (Closed Cup)
Evaporation rate:	No data available.
Flammability (solid, gas):	Class IB Flammable Liquid
Upper/lower limit on flammability or explosive limits	
Flammability limit - upper (%):	12.8 %(V)
Flammability limit - lower (%):	2.6 %(V)
Explosive limit - upper (%):	No data available.
Explosive limit - lower (%):	No data available.
Vapor pressure:	30.9 kPa (25 °C)
Vapor density:	2
Relative density:	0.7899 (4 °C)
Solubility(ies)	
Solubility in water:	Miscible with water.
Solubility (other):	alcohol: Very Soluble benzene: Soluble chloroform: Very Soluble ether: Very Soluble
Partition coefficient (n-octanol/water):	-0.24
Auto-ignition temperature:	869 °F
Decomposition temperature:	No data available.
Viscosity:	No data available.

Other information

Liquid conductivity:	0.06 µS/cm
Molecular weight:	58.08 g/mol (C3H6O)

10. Stability and reactivity

Reactivity:	No dangerous reaction known under conditions of normal use.
Chemical Stability:	Material is stable under normal conditions.
Possibility of hazardous reactions:	Hazardous polymerization does not occur.

Conditions to avoid:	Heat, sparks, flames.
Incompatible Materials:	Oxidizers, acids
Hazardous Decomposition Products:	Thermal decomposition or combustion may liberate carbon oxides and other toxic gases or vapors.

11. Toxicological information

Information on likely routes of exposure

Ingestion:	Harmful if swallowed.
Inhalation:	May cause irritation to the respiratory system.
Skin Contact:	Causes mild skin irritation. Prolonged or repeated skin contact may cause drying, cracking, or irritation.
Eye contact:	Causes eye irritation.

Information on toxicological effects

Acute toxicity (list all possible routes of exposure)

Oral
Product: LD 50 (Rat): 5,800 mg/kg

Dermal
Product: LD 50 (Rabbit): 20,000 mg/kg

Inhalation
Product: LC 50 (Rat, 4 h): 76 mg/l

Repeated dose toxicity
Product: No data available.

Skin Corrosion/Irritation
Product: Prolonged or repeated contact may cause irritation.

Serious Eye Damage/Eye Irritation
Product: Irritating to eyes.

Respiratory or Skin Sensitization
Product: Not a skin sensitizer.

Carcinogenicity
Product: This substance has no evidence of carcinogenic properties.

IARC Monographs on the Evaluation of Carcinogenic Risks to Humans:
No carcinogenic components identified

US. National Toxicology Program (NTP) Report on Carcinogens:
No carcinogenic components identified

US. OSHA Specifically Regulated Substances (29 CFR 1910.1001-1050):
No carcinogenic components identified

Germ Cell Mutagenicity

In vitro
Product: No mutagenic components identified

In vivo
Product: No mutagenic components identified

Reproductive toxicity
Product: Suspected of damaging fertility or the unborn child.

Specific Target Organ Toxicity - Single Exposure
Product: Respiratory tract irritation. Narcotic effect.

Specific Target Organ Toxicity - Repeated Exposure
Product: None known.

Aspiration Hazard
Product: Not classified

Other effects: None known.

12. Ecological information

Ecotoxicity:

Acute hazards to the aquatic environment:

Fish
Product: LC 50 (Fathead minnow (Pimephales promelas), 96 h): 5,490 - 7,030 mg/l Mortality
LC 50 (Bluegill (Lepomis macrochirus), 96 h): 8,300 mg/l Mortality

Aquatic Invertebrates
Product: LC 50 (Brine shrimp (Artemia salina), 24 h): 2,100 mg/l Mortality
LC 50 (Water flea (Daphnia magna), 48 h): 12,100 mg/l Mortality

Chronic hazards to the aquatic environment:

Fish
Product: No data available.

Aquatic Invertebrates
Product: No data available.

Toxicity to Aquatic Plants
Product: No data available.

Persistence and Degradability

Biodegradation
Product: Expected to be readily biodegradable.

BOD/COD Ratio
Product: No data available.

Bioaccumulative Potential
Bioconcentration Factor (BCF)
Product: No data available on bioaccumulation.

Partition Coefficient n-octanol / water (log Kow)
Product: Log Kow: -0.24

Mobility in Soil:	No data available.
Other Adverse Effects:	The product components are not classified as environmentally hazardous. However, this does not exclude the possibility that large or frequent spills can have a harmful or damaging effect on the environment.

13. Disposal considerations

Disposal instructions:	Discharge, treatment, or disposal may be subject to national, state, or local laws.
Contaminated Packaging:	Since emptied containers retain product residue, follow label warnings even after container is emptied.

14. Transport information

DOT

UN Number:	UN 1090
UN Proper Shipping Name:	Acetone
Transport Hazard Class(es)	
Class(es):	3
Label(s):	3
Packing Group:	II
Marine Pollutant:	Not a Marine Pollutant
Special precautions for user:	–

IMDG

UN Number:	UN 1090
UN Proper Shipping Name:	ACETONE
Transport Hazard Class(es)	
Class(es):	3
Label(s):	3
EmS No.:	F-E, S-D
Packing Group:	II
Marine Pollutant:	Not a Marine Pollutant
Special precautions for user:	–

IATA

UN Number:	UN 1090
Proper Shipping Name:	Acetone
Transport Hazard Class(es):	
Class(es):	3
Label(s):	3
Marine Pollutant:	Not a Marine Pollutant
Packing Group:	II
Special precautions for user:	–

15. Regulatory information

US Federal Regulations

TSCA Section 12(b) Export Notification (40 CFR 707, Subpt. D)

US. OSHA Specifically Regulated Substances (29 CFR 1910.1001-1050)

None present or none present in regulated quantities.

CERCLA Hazardous Substance List (40 CFR 302.4):

Chemical Identity	Reportable quantity
ACETONE	5000 lbs.

Superfund Amendments and Reauthorization Act of 1986 (SARA)

Hazard categories
Acute (Immediate)
Fire

SARA 302 Extremely Hazardous Substance
None present or none present in regulated quantities.

SARA 304 Emergency Release Notification

Chemical Identity	Reportable quantity
ACETONE	5000 lbs.

SARA 311/312 Hazardous Chemical

Chemical Identity	Threshold Planning Quantity
ACETONE	10000 lbs

SARA 313 (TRI Reporting)
None present or none present in regulated quantities.

Clean Water Act Section 311 Hazardous Substances (40 CFR 117.3)
None present or none present in regulated quantities.

Clean Air Act (CAA) Section 112(r) Accidental Release Prevention (40 CFR 68.130):
None present or none present in regulated quantities.

US State Regulations

US. California Proposition 65
No ingredient regulated by CA Prop 65 present.

US. New Jersey Worker and Community Right-to-Know Act

After printing this label:
1. Use the 'Print' button on this page to print your label to your laser or inkjet printer.
2. Fold the printed page along the horizontal line.
3. Place label in shipping pouch and affix it to your shipment so that the barcode portion of the label can be read and scanned.

Warning: Use only the printed original label for shipping. Using a photocopy of this label for shipping purposes is fraudulent and could result in additional billing charges, along with the cancellation of your FedEx account number.
Use of this system constitutes your agreement to the service conditions in the current FedEx Service Guide, available on fedex.com.FedEx will not be responsible for any claim in excess of $100 per package, whether the result of loss, damage, delay, non-delivery,misdelivery,or misinformation, unless you declare a higher value, pay an additional charge, document your actual loss and file a timely claim.Limitations found in the current FedEx Service Guide apply. Your right to recover from FedEx for any loss, including intrinsic value of the package, loss of sales, income interest, profit, attorney's fees, costs, and other forms of damage whether direct, incidental,consequential, or special is limited to the greater of $100 or the authorized declared value. Recovery cannot exceed actual documented loss.Maximum for items of extraordinary value is $1,000, e.g. jewelry, precious metals, negotiable instruments and other items listed in our ServiceGuide. Written claims must be filed within strict time limits, see current FedEx Service Guide.

Subject: Region 08 | Case 46114 | Lab CHM | Issue Discrepancies with tags, jars, and/or COC | FINAL
Attachments: 46114-0507.pdf

Sohil,

Issue: The water samples for this Case are scheduled for 86 TVOA and 17 SVOA analysis; however, the COCs list VOA=TCL VOCs by CLP.

Resolution: Per Region 8, the samples in question shall be analyzed as scheduled for TVOA. The laboratory will note the issue in the SDG Narrative and proceed with analysis of the samples. This resolution may be applied to all COCs received for this Case with this issue.

Please let me know if you have any questions. To waive any defect(s) associated with this issue, please contact your Regional CLP COR.

Thanks,

Subject: RE: Region 08 | Case 46114 | Lab CHM | Issue Discrepancies with tags, jars, and/or COC

Hi Don,

Should this resolution be applied to all COCs received for this Case with this issue?

Thanks,

ALEXANDRA VANAMAN

Good morning,

CHM is reporting the following issue regarding Case 46114. Please advise.

Issue: The water samples for this Case are scheduled for 86 TVOA and 17 SVOA analysis; however, the COCs list VOA=TCL VOCs by CLP.

Thanks,

Subject: Region 08 | Case 46114 | Lab CHM | SDG multiple | Issue Discrepancies with tags, jars, and/or COC

Hi Alexandra,

Samples received today with 05/07 shipment and lab would like to confirm below.

Issue: As per ASR, water samples are scheduled for TVOA analysis but analysis key written on the COC is VOA=TCL VOCs by CLP so lab would like to confirm that Lab is following the ASR and doing analysis for TVOA for water samples, Please advise.

This issue is addressing for all previous shipments also.

Thanks & Regards,

Subject: Region 08 | Case 46114 | Lab CHM | SDG H4082 | Issue Insufficient volume | FINAL

Sohil,

Issue: The laboratory received two soil samples for VOA and SVOA analysis. Lab QC is required; however, no sample was designated for Lab QC for soil matrix in the COC. The laboratory would like to select sample H4086 for SVOA analysis. The laboratory does not have sufficient volume for VOA Laboratory QC, even at reduced volume.

Resolution: Per Region 8, sample H4086 selected for SVOA laboratory QC is acceptable to the Region. Cancel VOA laboratory QC due to insufficient volume along with noting the issue in the SDG Narrative.

Please let me know if you have any questions. To waive any defect(s) associated with this issue, please contact your Regional CLP COR.

Thanks,

Subject: Region 08 | Case 46114 | Lab CHM | SDG H4082 | Issue Discrepancies with tags, jars, and/or COC

Good Morning Alexandra,

After further review of 05/05 shipment and found below discrepancy,

Issue: Two soil samples received with this shipment for VOA and SVOA analysis. As per ASR, lab QC is required for VOA and SVOA soil analysis but there is no sample designated for Lab QC for soil matrix in the COC so Lab would like to have permission to use sample H4086 for Lab QC for SVOA analysis as Lab have sufficient volume but Lab did not receive any extra volume for VOA Lab QC analysis so Lab can close the SDG without VOA Lab QC as today is the 7th day of this SDG and Lab did not receive any shipment for this case.

Please see attachment for your reference.

STATEMENT OF TECHNICAL REVIEW

AOU-1 Remedial Investigation for 700 South 1600 East PCE Plume, Salt Lake City, UT
Final 2017 Vapor Intrusion Investigation Field Data Report

The CH2M HILL, Inc. team has completed the technical review of the submittal of the Final 2017 Vapor Intrusion Investigation Field Data Report. Notice is hereby given that an independent technical review has been conducted that is appropriate to the level of risk and complexity inherent in the project, as defined in the Contractor Quality Control Plan. During the independent technical review, compliance with established policy principles and procedures was verified using justified and valid assumptions. This included review of assumptions; methods, procedures, and material used in analyses; the appropriateness of data used and level of data obtained; and reasonableness of the results, including whether the product meets the customer's needs consistent with the law and existing U.S. Army Corps of Engineers policy.

SECTION 1

Introduction and Background

This report presents analytical results from the 2017 vapor intrusion (VI) investigation for Accelerated Operable Unit 1 East Side Springs (AOU-1), which is part of the 700 South 1600 East Tetrachloroethene (PCE) Plume Superfund site in Salt Lake City, Utah. This report is being submitted on behalf of the U.S. Department of Veterans Affairs Salt Lake City Health Care System, which is working cooperatively with the U.S. Environmental Protection Agency (EPA) and the Utah Department of Environmental Quality to implement the remedial investigation (RI). The VI investigation results included in this report supplement the indoor air and soil gas sampling performed in 2015 and 2016. The 2015 and 2016 sampling was guided by the RI Work Plan (First Environment [FE], 2015) that included the sampling and analysis plan and quality assurance (QA) project plan attachments. The data collection activities briefly described in this report are based on those detailed in the *Minor Field Modification* (MFM) *#18* (Appendix A) (EA Engineering, Science, and Technology, Inc., PBC [EA], 2017) to the RI Work Plan (FE, 2015). Results of these data collection activities will help the Veterans Health Administration (VHA) refine the conceptual site model describing the nature, extent, fate, and transport of PCE associated with the PCE plume, specifically with respect to the potential for impacts to indoor air through the subsurface-to-indoor-air VI pathway.

AOU-1 is located in Salt Lake City, Salt Lake County, Utah, along the Wasatch Fault scarp within the general residential area bounded by 500 South and Michigan Avenue between 1100 East and 1300 East (Figure 1). In 2010, chlorinated volatile organic compounds (VOCs), including PCE and trichloroethene (TCE), were detected in the surface water associated with seeps and springs along the fault scarp. The location of the seeps and springs near residences and other occupied structures and the shallow depth to groundwater suggested the potential for VI into occupied structures. AOU-1 is defined as the area where springs are known to have PCE contamination and groundwater is within 50 feet of the ground surface. AOU-1 is surrounded by a 100-foot buffer zone.

SECTION 2

Summary of Previous Characterization Activities

VHA began collecting site-specific VI data within AOU-1 in January 2015 (FE, 2015). More than 1,000 soil gas and indoor air data points were collected from 35 structures consisting of private residences, schools, a church, and an elder-care facility. The structures represent a cross section of structure types, construction dates, depths to groundwater, and locations within AOU-1. Analytical results from those samples were used to update the conceptual site model for AOU-1, which in turn was used to identify data gaps and to prepare a sampling plan (EA, 2015) to fill those gaps.

The VI data collected in 2015 pointed to a portion of AOU-1 where a higher potential for VI to result in indoor air concentrations above risk-based screening levels (RBSLs) was noted. These data, combined with AOU-1 hydrogeological data, facilitated the delineation of a focus area for the 2016 VI sampling. In 2016, 10 residential and 1 public structure (East High School) within the 2016 focus area underwent individual VI investigation as outlined in the 2016 sampling plan (EA, 2015). The 2016 VI sampling activities and results are presented in the *2016 Vapor Intrusion Investigation Field Data Report* (EA, 2016).

The combined 2015 and 2016 VI sampling data were used to again update the AOU-1 conceptual site model, which facilitated the identification of a few remaining data gaps. The seven new residential structures sampled in 2017 were selected based on the 2015/2016 data to address the identified data gaps, as detailed in Section 3 of this report.

SECTION 3

Summary of 2017 Characterization Activities

This section presents a summary of, and rationale for, additional VI sampling activities conducted within AOU-1 from March 2017 to April 2017. Further detail regarding 2017 VI sampling methodology can be found in the MFM #18 (EA, 2017) to the RI Work Plan (FE, 2015). The 2017 VI program consisted of sampling 7 new structures (that is, not previously sampled as part of the 2015 and 2016 effort) and 11 previously sampled structures (previously sampled in 2015) in an area with higher potential for VI. The seven new structures (residential) were located in areas that had not previously been sampled and were selected to improve the spatial data distribution of AOU-1. The 11 previously sampled structures were re-sampled in 2017 to confirm the 2015 indoor air results, which are currently under third-party quality review due to uncertainty regarding correct sampling and field documentation procedures. Table 1 lists the number and type of samples collected at the 11 previously sampled structures and 7 new structures. Details for each of these objectives are provided in the following subsections.

3.1 2017 Sampling Focus Area

The VI data collected in 2015 and 2016 pointed to a portion of AOU-1 where a higher potential for VI to result in indoor air concentrations above RBSLs was noted. These data, combined with AOU-1 hydrogeological data, facilitated the identification of seven new structures to undergo full VI protocol sampling to improve the AOU-1 conceptual site model (Figure 2). In 2017, 7 new structures and 11 previously sampled structures underwent full and limited VI protocol sampling, respectively. See below for a definition of what constitutes a full and a limited protocol. The locations of these structures are shown on Figure 2. Collection of additional VI data from these residential structures within this focus area was conducted to support preparation of the RI report, including refining the conceptual model of VI within AOU-1 and evaluating potential risk.

3.2 Locations and Methods

The following three sampling goals outlined in the RI Work Plan were to be satisfied with the additional 2017 sampling:

- Sampling indoor air with EPA Method TO-15 analysis at 11 previously sampled structures to assess temporal variability in potential VI-related indoor air PCE concentrations and help address uncertainty related to 2015 TO-15 analytical results (Section 3.2.1).
- Sampling seven new (not previously sampled) structures within the focus area to assess spatial variability. This included screening indoor air and near-slab soil gas using a portable gas chromatograph/mass spectrometer called an INFICON HAPSITE® (HAPSITE). EPA Method TO-15 analysis of both indoor air and soil gas was also specified in the event an RBSL exceedance occurred during HAPSITE indoor air and soil gas screening.
- Analyze indoor air concentrations of PCE, TCE, cis-1,2-dichloroethene (DCE), vinyl chloride, and 1,4-dioxane by EPA Method TO-15 Selected Ion Monitoring (SIM) and other VOCs by EPA Method TO-15. Additionally, analyze indoor air PCE, TCE, and cis-1,2-DCE concentrations with a HAPSITE. The following subsections describe the locations and methods for each sampling goal.

3.2.1 Previously Sampled Structures

In 2015, VI data were collected from 36 structures within AOU-1 using the Protocol for Performing Indoor Air and Near-slab Soil Gas Assessments (i.e., *Full VI Protocol,* Appendix H of the RI Work Plan [FE, 2015]). Eleven of these previously sampled structures were re-sampled in 2017 following the limited VI protocol sampling to confirm the 2015 indoor air results, which are currently under third-party quality review due to uncertainty regarding correct sampling and field documentation procedures.

Confirmation samples were collected per Attachment 1 of MFM #18 (EA, 2017), utilizing a limited VI protocol that includes HAPSITE screening of indoor air to identify potential interior background source(s) (no pressure cycling) and collection of up to 2, 24-hour SUMMA™ canister samples per structure of indoor air for EPA Method TO-15 and TO-15 SIM analysis. Soil gas and ambient air samples were not collected. Other components of the VI protocol (FE, 2015), such as detailed building surveys, were not repeated. Instead, an abbreviated interview and building survey were performed to identify any major changes that could have affected the 2017 sampling and data evaluation (recent remodels or household chemical storage, for example). Attachment 1 of MFM #18 (EA, 2017) presents a copy of the full VI protocol that conveys, in detail (via text highlights), those steps of the protocol that were retained in the limited VI protocol used for confirmation sampling. Table 1 lists the type of samples collected at these 11 structures and Figure 2 shows the locations of the SUMMA confirmation samples.

As noted, up to 2, 24-hour SUMMA canister samples were collected from each structure. The determination of where samples were collected and conditions under which an additional sample may be warranted is described in the *Limited VI Protocol* (Attachment 1 of MFM #18 [EA, 2017]).

3.2.2 New Structures

The goal of sampling structures not previously sampled during 2015 and 2016 was to gain a better understanding of the spatial extent of potential VI-related impacts associated with AOU-1 groundwater. Additional structures within the focus area are identified on Figure 2 and in Table 1. The 7 new structures underwent full VI protocol sampling (HAPSITE screening of indoor air to identify potential interior background sources, pressure cycling, and collection of up to 2, 24-hour SUMMA canister samples per structure, if an indoor air RBSL(s) exceedance was measured with the HAPSITE), as outlined in MFM #18 (EA, 2017). The VI protocol (FE, 2015) guided data collection at these structures. This included HAPSITE screening of indoor air and near-slab soil gas and EPA Method TO-15 analysis of both if screening levels were exceeded during HAPSITE screening of each.

SECTION 4

Results

Findings from the 2017 sampling event are summarized in the following subsections. This section is divided into subsections based on data collection activities outlined in Section 3 (previously sampled structures and new structures). Analytical results are compared to RBSLs and removal action levels (RALs) presented in Table 2.

4.1 Previously Sampled Structures (Limited VI Protocol)

Table 3 contains analytical results for the confirmation EPA Method TO-15 SIM samples collected at locations 0001-H, 0002-H, 0004-H, 0012-H, 0013-H, 0025-H, 0026-H, 0027-H, 0029-H, 0038-H, and 0064-H (Figure 2). These samples were 24-hour indoor air samples collected in 6-liter SUMMA canisters that had been individually laboratory-certified clean. Each sample was analyzed using EPA Method TO-15 and TO-15 SIM. Validated analytical results are provided in the *Quality Control Summary Report* (provided as Appendix B) and laboratory sample receipt notifications are provided as Appendix C. Indoor air in these previously sampled structures was screened with a HAPSITE to identify potential interior background source(s) (no pressure cycling) prior to 24-hour SUMMA canister sample collection. HAPSITE calibration reports associated with sampled locations are included in Appendix D and are organized by calibration date. The following subsections present the results of each limited VI protocol sampling event by structure.

4.1.1 0001-H

The limited VI protocol investigation at location 0001-H was conducted on March 15, 2017 and March 22, 2017. Two sample dates were required because the initial HAPSITE survey identified an interior background source containing PCE beneath the upstairs kitchen sink. The product was removed from the residence and a second appointment scheduled to collect a 24-hour SUMMA canister sample. A normal and field duplicate 24-hour SUMMA canister sample were collected at this residence. Table 3 and Table 4 present the EPA Method TO-15 and HAPSITE analytical results, respectively.

Vinyl chloride was the only target analyte that exceeded an indoor air RBSL but not the RAL at 0.17 and 0.19 micrograms per cubic meter ($\mu g/m^3$) in the normal and field duplicate samples, respectively (Table 3).

4.1.2 0002-H

The VI investigation at location 0002-H was conducted on March 22, 2017. No interior background sources were identified within the residence during the HAPSITE survey. Table 5 presents the HAPSITE survey analytical results for this structure.

The 24-hour SUMMA canister indoor air sample was collected in the basement living room. No target analytes exceeded indoor air RBSLs or RALs within the breathing zone during the HAPSITE survey or the 24-hour SUMMA canister sampling at this structure (Tables 3 and 5, respectively).

4.1.3 0004-H

The VI investigation at location 0004-H was conducted on March 13, 2017. No interior background sources were identified within the residence during the HAPSITE survey. Table 6 presents the HAPSITE survey analytical results for this structure.

The 24-hour SUMMA canister indoor air sample was collected in the basement (single large room). No target analytes exceeded indoor air RBSLs or RALs within the breathing zone during the HAPSITE survey or the 24-hour SUMMA canister sampling at this structure (Tables 3 and 6, respectively).

4.1.4 0012-H

The VI investigation at location 0012-H was conducted on March 13, 2017. No interior background sources were identified within the residence during the HAPSITE survey. Table 7 presents the HAPSITE survey analytical results for this structure.

The 24-hour SUMMA canister indoor air sample was collected in the basement living room. No target analytes exceeded indoor air RBSLs or RALs within the breathing zone during the HAPSITE survey or the 24-hour SUMMA canister sampling at this structure (Tables 3 and 7, respectively).

4.1.5 0013-H

The VI investigation at location 0013-H was conducted on March 9, 2017. No interior background sources were identified within the residence during the HAPSITE survey. Table 8 presents the HAPSITE survey analytical results for this structure.

The 24-hour SUMMA canister indoor air sample was collected in the basement living room. No target analytes exceeded indoor air RBSLs or RALs within the breathing zone during the HAPSITE survey or the 24-hour SUMMA canister sampling at this structure (Tables 3 and 8, respectively).

4.1.6 0025-H

The VI investigation at location 0025-H was conducted on March 13, 2017. No interior background sources were identified within the residence during the HAPSITE survey. Table 9 presents the HAPSITE survey analytical results for this structure.

The 24-hour SUMMA canister indoor air sample was collected in the basement living room. 1,4-Dioxane was detected at 2.3 $\mu g/m^3$, which exceeded the 1,4-Dioxane RBSL (0.56 $\mu g/m^3$) but not the RAL (Table 3). No other target analytes exceeded indoor air RBSLs or RALs within the breathing zone during the HAPSITE survey or the 24-hour SUMMA canister sampling at this structure (Tables 3 and 9, respectively).

4.1.7 0026-H

The VI investigation at location 0026-H was conducted on March 9, 2017. No interior background sources were identified within the residence during the HAPSITE survey. Table 10 presents the HAPSITE survey analytical results for this structure.

The 24-hour SUMMA canister indoor air sample was collected in the basement living room. The initial 24-hour SUMMA canister indoor air sample was deployed on March 9, 2017. Upon retrieval of the initial canister on March 10, 2017 the final vacuum was positive; therefore, a new canister was deployed on March 15, 2017 and retrieved on March 16, 2017. The second canister was analyzed and the initial canister was not. No target analytes exceeded indoor air RBSLs or RALs within the breathing zone during the HAPSITE survey or the 24-hour SUMMA canister sampling at this structure (Tables 3 and 10, respectively).

4.1.8 0027-H

The VI investigation at location 0027-H was conducted on March 9, 2017. No interior background sources were identified within the residence during the HAPSITE survey. Table 11 presents the HAPSITE survey analytical results for this structure.

The 24-hour SUMMA canister indoor air sample was collected in the basement laundry room. A normal and a field duplicate 24-hour SUMMA canister sample were collected. No target analytes exceeded indoor air RBSLs or RALs within the breathing zone during the HAPSITE survey or the 24-hour SUMMA canister sampling at this structure (Tables 3 and 11, respectively).

4.1.9 0029-H

The VI investigation at location 0029-H was conducted on March 30, 2017. No interior background sources were identified within the residence during the HAPSITE survey. Table 12 presents the HAPSITE survey analytical results for this structure.

The 24-hour SUMMA canister indoor air sample was collected in the basement living room. No target analytes exceeded indoor air RBSLs or RALs within the breathing zone during the HAPSITE survey or the 24-hour SUMMA canister sampling at this structure (Tables 3 and 12, respectively).

4.1.10 0038-H

The VI investigation at location 0038-H was conducted on April 10, 2017. No interior background sources were identified within the residence during the HAPSITE survey. Table 13 presents the HAPSITE survey analytical results for this structure.

The 24-hour SUMMA canister indoor air sample was collected in the basement living room. A normal and field duplicate 24-hour SUMMA canister sample were collected. No target analytes exceeded indoor air RBSLs or RALs within the breathing zone during the HAPSITE survey or the 24-hour SUMMA canister sampling at this structure (Tables 3 and 13, respectively).

4.1.11 0064-H

The VI investigation at location 0064-H was conducted on April 13, 2017. This location was not previously sampled in 2015, but was sampled in 2017 following the resident's request. The residence underwent a limited VI protocol sampling event, per the request of VHA. No interior background sources were identified within the residence during the HAPSITE survey. Table 14 presents the HAPSITE survey analytical results for this structure.

The 24-hour SUMMA canister indoor air sample was collected in the ground-level living room (single-story residence). No target analytes exceeded indoor air RBSLs or RALs within the breathing zone during the HAPSITE survey or the 24-hour SUMMA canister sampling at this structure (Tables 3 and 14, respectively).

4.2 New Structures (Full VI Protocol)

The following subsections present the analytical results of the HAPSITE survey/pressure-cycling along with sample locations and sample condition descriptions for the seven new structures sampled in 2017 (0057-H, 0058-H, 0059-H, 0060-H, 0061-H, 0062-H, and 0063-H). HAPSITE calibration reports are included in Appendix D and are organized by calibration date. HAPSITE calibration parameters were within the specifications defined in the RI Work Plan (FE, 2015).

4.2.1 0057-H

The VI investigation at location 0057-H was conducted on April 5, 2017. No interior background sources were identified within the residence during the HAPSITE survey. Three targeted differential pressures (-5, -10, and 5 pascals [Pa]) were achieved during pressure cycling. Approximately 2.5 air volumes were exchanged during each pressure step. Table 15 presents the HAPSITE analytical results from the HAPSITE survey and the pressure cycling event at this structure.

No target analytes exceeded indoor air RBSLs or RALs within the breathing zone during the HAPSITE survey and pressure cycling event at this structure (Table 15). No indoor air samples were collected for EPA Method TO-15 analysis.

No target analytes were detected above the soil gas RBSL in the near-slab soil gas (Table 15).

4.2.2 0058-H

The VI investigation at location 0058-H was conducted on March 6, 2017. No interior background sources were identified within the residence during the HAPSITE survey. Three targeted differential pressures (-5, -10, and 5 Pa) were achieved during pressure cycling. Approximately 2.5 air volumes were exchanged during each pressure step. Table 16 presents the HAPSITE analytical results from the HAPSITE survey and the pressure cycling event at this structure.

No target analytes exceeded indoor air RBSLs or RALs within the breathing zone during the HAPSITE survey and pressure cycling event at this structure (Table 16). No indoor air samples were collected for EPA Method TO-15 analysis.

No target analytes were detected above the soil gas RBSL in the near-slab soil gas (Table 16).

4.2.3 0059-H

The VI investigation at location 0059-H was conducted on March 17, 2017. No interior background sources were identified within the residence during the HAPSITE survey. Three targeted differential pressures (-5, -10, and 5 Pa) were achieved during pressure cycling. Approximately 2.5 air volumes were exchanged during each pressure step. Table 17 presents the HAPSITE analytical results from the HAPSITE survey and the pressure cycling event at this structure.

Vapors entering the residence basement laundry room floor drain during induced negative pressure exceeded both the PCE indoor air RBSL and RAL and the TCE indoor air RBSL. Vapor screening samples were collected with the HAPSITE probe 1 inch above the floor drain and not in the breathing zone. All screening samples collected within the breathing zone during the HAPSITE survey and pressure cycling were below the indoor air RBSLs (Table 17). For this reason, no indoor air samples were collected for EPA Method TO-15 analysis, in accordance with the approved VI sampling protocol.

No target analytes were detected above the soil gas RBSL in the near-slab soil gas (Table 17).

4.2.4 0060-H

The VI investigation at location 0060-H was conducted on March 7, 2017. No interior background sources were identified within the residence during the HAPSITE survey. Three targeted differential pressures (-5, -10, and 5 Pa) were achieved during pressure cycling. Approximately 2.5 air volumes were exchanged during each pressure step. Table 18 presents the HAPSITE analytical results from the HAPSITE survey and the pressure cycling event at this structure.

No target analytes exceeded indoor air RBSLs or RALs within the breathing zone during the HAPSITE survey and pressure cycling event at this structure (Table 18). No indoor air samples were collected for EPA Method TO-15 analysis.

No target analytes were detected above the soil gas RBSL in the near-slab soil gas (Table 18).

4.2.5 0061-H

The VI investigation at location 0061-H was conducted on March 8, 2017. No interior background sources were identified within the residence during the HAPSITE survey. Three targeted differential pressures (-5, -10, and 5 Pa) were achieved during pressure cycling. Approximately 2.5 air volumes were

exchanged during each pressure step. Table 19 presents the HAPSITE analytical results from the HAPSITE survey and the pressure cycling event at this structure.

No target analytes exceeded indoor air RBSLs or RALs within the breathing zone during the HAPSITE survey and pressure cycling event at this structure (Table 19). No indoor air samples were collected for EPA Method TO-15 analysis.

No target analytes were detected above the soil gas RBSL in the near-slab soil gas (Table 19).

4.2.6 0062-H

The VI investigation at location 0062-H was conducted on March 29, 2017. No interior background sources were identified within the residence during the HAPSITE survey. Three targeted differential pressures (-5, -10, and 5 Pa) were achieved during pressure cycling. Approximately 2.5 air volumes were exchanged during each pressure step. Table 20 presents the HAPSITE analytical results from the HAPSITE survey and the pressure cycling event at this structure.

No target analytes exceeded indoor air RBSLs or RALs within the breathing zone during the HAPSITE survey and pressure cycling event at this structure (Table 20). No indoor air samples were collected for EPA Method TO-15 analysis.

No target analytes were detected above the soil gas RBSL in the near-slab soil gas (Table 20).

4.2.7 0063-H

The VI investigation at location 0063-H was conducted on March 21, 2017. Three interior background sources containing PCE were identified within the residence during the HAPSITE survey. These three products were removed from residence prior to pressure cycling. One additional PCE-containing product was identified at the beginning of the 5 Pa pressure cycle and was removed from the residence. Three targeted differential pressures (-5, -10, and 5 Pa) were achieved during pressure cycling. Approximately 2.5 air volumes were exchanged during each pressure step. Table 21 presents the HAPSITE analytical results from the HAPSITE survey and the pressure cycling event at this structure.

No target analytes exceeded indoor air RBSLs or RALs within the breathing zone during the HAPSITE survey and pressure cycling event at this structure (Table 21). No indoor air samples were collected for EPA Method TO-15 analysis.

No target analytes were detected above the soil gas RBSL in the near-slab soil gas (Table 21).

4.2.8 Additional Information

All field notes were scribed in spiral-bound notebooks during the 2017 sampling events. These notebooks included a field logbook, HAPSITE field forms, SUMMA field forms, pressure cycling field forms, VI investigation QA assurance checklist forms, and daily report forms. A scanned copy of all field notes is included in Appendix E. Chain-of-custody forms and Analytical Request forms for the EPA Method TO-15 and TO-15 SIM samples collected during the 2017 sampling events also are included in Appendix E. All field documentation was scanned and sent to the VHA and U.S. Army Corps of Engineers (USACE) for quality control review on a weekly basis for the first three weeks of sampling. Appendix F contains the native HAPSITE data reports for each sampled location.

In an effort to ensure that field documentation was performed in accordance with the QAPP and Sampling and Analysis Plan (SAP), a pre-field kickoff meeting took place with the field staff to discuss field documentation and the requirements of the QAPP and SAP prior to any sampling. A daily QA checklist to monitor compliance with the QAPP was completed.

Furthermore, quality assurance protocols were implemented to ensure supplemental sampling data would achieve project data quality objectives. During the first week of VI sampling, the USACE provided oversight in the field and an in-person meeting with the contractor, regulators, and VHA was conducted to review field documentation for accuracy and completeness. Additionally, the VHA and USACE routinely spot-checked field documentation throughout the sampling event. This was accomplished by submitting electronic scanned copies of all completed field documentation to the VHA and USACE weekly for review. Any noncompliance issues were identified and adjustments by the field team were made to resolve them. All field documentation is presented in Appendix E.

4.3 Deviations from Remedial Investigation Work Plan

During the 2017 VI investigative work, there was no deviations from the RI Work Plan (SAP, Appendix B of the RI Work Plan [FE, 2015]) and MFM #18 (Appendix A) (EA, 2017).

[a] TO-15 and TO-15 SIM confirmation samples were only to be collected at full VI protocol structures (new structures) if a residential indoor air screening level and/or soil gas screening level was exceeded during full VI protocol sampling. No residential indoor air and soil gas screening levels were exceeded during full VI protocol investigations. TO-15 and TO-15 SIM indoor air confirmation samples were collected at all limited VI protocol structures (previously sampled structures).

Notes:

Table 3 contains the TO-15 SIM analytical results. See Appendix B for TO-15 analytical results.

Bolded values are detections.

Shaded values are screening level exceedances.

µg/m³ = micrograms per cubic meter

AOU-1 = Accelerated Operable Unit 1 East Side Springs

EPA = U.S. Environmental Protection Agency

FD = field duplicate

IASL = residential indoor air screening level

ID = identification

J = Estimated value. The result is estimated due to associated quality control problems.

N = normal sample

RAL = residential removal action level

Res. = residential

SIM = selected ion monitoring

U = Not detected. The analyte was analyzed for but not detected above the method detection limit.

4/3/2017	10:33	2	CV2-040317	Calibration check	140%[a]		134%[a]	132%[a]	Relative percent difference (acceptable range > 70% or < 130%)

[a] No action was taken due to these RPD exceedances since prior sample results were either nondetect or below RSLs. A high RPD indicates that sample results are biased higher than the actual concentration. That is, actual indoor air detections are biased higher than the actual indoor air concentrations. For example, the TCE RPD for CV2-040317 was 134% and the TCE CV result for was 6.7 ppbv for a known calibration gas of 5 ppbv.

SUBJECT: Minor Field Modification to the Remedial Investigation Work Plan AOU-1: East Side Springs 700 South 1600 East PCE Plume Salt Lake City, Utah (July 2015)

1. Introduction

This document provides a description of the minor field modification to the Remedial Investigation Work Plan (RIWP) AOU-1: East Side Springs 700 South 1600 East Tetrachloroethene (PCE) Plume Salt Lake City, Utah (First Environment, Inc. [FE] 2015a) to conduct additional vapor intrusion (VI) sampling at up to 13 previously sampled structures and at up to seven new (not previously sampled) structures as described below. Minor Field Modifications #1 - #17 were provided in separate documents and detail changes to the RIWP and the Sampling and Analysis Plan (SAP) (Appendix A of the RIWP). The following modification is detailed below:

- Minor Field Modification (MFM) #18 – Supplemental VI sampling will be conducted in accordance with the protocols described in the sections below. This field modification includes additional VI sampling at up to 13 structures previously sampled in 2015 and up to seven new (not previously sampled) structures in an attempt to fill potential data gaps from the 2015 and 2016 AOU-1 remedial investigation (RI) VI evaluation. The supplemental sampling is being performed in the event that some or all of the 2015 HAPSITE and TO-15 VI investigation data is determined to be unusable. Usability is being assessed through verification of field and laboratory data, which has identified field notation discrepancies in addition to non-compliance with the project plans. The determination of 2015 VI data usability and whether the data meets project objectives is still in process.

  The 13 structures to be resampled were selected from the 2015 indoor air sampling locations by evaluating the 2016 groundwater and surface water data and selecting the 2015 indoor air sampling locations where 1) groundwater is known to be impacted by PCE, 2) where estimated depth to groundwater was less than fifty feet below ground surface, and 3) where 2016 surface water data (EA 2017) indicates elevated PCE concentrations in the vicinity of PCE impacted groundwater area 4) and the western most edge of the investigation area in the direction of groundwater flow where there is currently no data. The southwest extent of the groundwater PCE plume was not defined during the RI due to limitations of the Geoprobe (which could not drill to

depths exceeding 40 ft bgs). Therefore, locations 0010-H and 0028-H, near the presumed southwest extent of the shallow PCE plume were also retained for confirmation sampling.

The seven new structures were selected by contacting property owners in, or near, the data gap areas from the 2015 and 2016 AOU-1 RI VI evaluation and/or by soliciting volunteers downgradient of the data gap areas. Initial RI data evaluation suggests PCE impact in shallow (i.e., less than 50 ft bgs) groundwater near and east of the intersection of 900 South and 1100 East, and west of 1300 East. There were multiple residences that fell within this area of the shallow PCE GW plume who did not volunteer to have sampling conducted. Some of these residences have since granted access and the structures have been included for VI evaluation The supplemental sampling will be performed in accordance with the work plan requirements and this MFM to ensure data of sufficient quantity and quality are obtained to achieve project data quality objectives.

- In the event that the 2015 data usability assessment determines that some or all of the 2015 data is not usable or does not meet project objectives, the confirmation sampling with the additional new sample locations is expected to be adequate to meet the data quality objectives as outlined in Table 3 of the QAPP (Summary of Data Quality Objective Process). Specifically, principal study questions 1 and 2 of the DQO process address the problem statement regarding indoor air as indicated below:
    - Question 1 - Does vapor intrusion present a complete pathway to structures overlying AOU-1 and is it significant?
    - Question 2 – What is the lateral extent of AOU-1 groundwater contamination that may result in a complete pathway and significant vapor intrusion exposures in overlying structures?

  Data inputs with regard to addressing the indoor air path for both of these questions include (amongst others): indoor air VOC concentrations (collected over temporal and spatial ranges); shallow soil gas VOC concentrations; and groundwater and surface water VOC concentrations from the areas where surface water and groundwater have PCE contamination and is within 50 ft of the ground surface (plus a buffer of 100 ft) (EA 2017). Groundwater and surface water data collected to date in support of the RI have suggested that the area of PCE contamination in springs and groundwater within 50 ft of ground surface is generally located east of McClelland Street, west of 1300 East, south of 700 South and north of Yale (see preliminary PCE in groundwater contours on Figure 1). While not all of the 36 structures from the 2015 sampling event are included for confirmation sampling (many of which are outside this area), each of the confirmation samples (as well as the new VI sampling locations) are within this area. SUMMA TO-15 SIM data is propose be collected from each of the confirmation sampling locations and from those new locations where HAPSITE® results indicate exceedance of screening criteria. The QAPP also indicates that making the indoor air sampling available to owners of any structure within and adjacent to AOU-1 who volunteer for sampling will meet the acceptance criteria for the acceptable number of data points. These proposed confirmation and new sampling locations target areas within the bounds of AOU-1, will result in collection of data necessary to meet the project objectives, fulfills the spirit of sampling the structure of any volunteer within the AOU-1 boundary, and therefore, are expected to meet the data and project objectives as outlined in the QAPP.

2. Minor Field Modification #18 – Proposed Sampling Plan

This section presents the rationale and details for additional AOU-1 VI sampling. Sampling at up to seven new structures (not previously sampled as part of the 2015 and 2016 RI sampling effort) and resampling at 13 previously sampled structures is proposed for the supplemental sampling program. The 2017 supplemental VI sampling will be conducted during the heating season and is currently scheduled to begin in early March 2017. Except where specifically noted within this MFM, the sampling will be performed in accordance with field, HAPSITE®, and laboratory methods and standard operating procedures (SOPs); indoor air and soil gas sampling protocols; quality control (QC) and quality assurance (QA) provisions; and data validation requirements presented in the following planning and procedural documents:

- RIWP (FE 2015a)
- Quality Assurance Project Plan (QAPP) Update Revision 1 (EA Engineering, Science, and Technology, Inc., PBC [EA] 2016a) and Revision 2 (Department of Veterans Affairs [VA] 2017)
- SAP (Attachment A of the RIWP, FE 2015a); and
- Minor Field Modifications
    - Minor Field Modification #1 to the RIWP - Protocol for Performing Indoor Air and Near-slab Soil Gas Assessments (FE 2015b);
    - Minor Field Modifications #3, #4, and #5 to the RIWP - Change of Analytical Method for Analysis of 1,4-Dioxane; Updates to the Analytical Methods, Parameters, and Sample Media; and Update of Health and Safety Plan (EA 2016b);
    - Minor Field Modifications #7 and #8 to the SAP - Change of Analytical Method for Analysis of 1,4-Dioxane and Updates to the Analytical Methods, Parameters, and Sample Media (EA 2016c)

Table 1 presents the type of information included in each of these documents that is relevant to the supplemental investigation.

2.1 SUMMA Confirmation Sampling

In 2015, VI data was collected from 36 structures within AOU-1 using the Protocol for Performing Indoor Air and Near-slab Soil Gas Assessments (i.e., "full VI protocol", Appendix H of the RIWP [FE 2015a]). During a third-party QA review of the 2015 VI field, electronic, and laboratory documentation, several discrepancies and instances of noncompliance with the QAPP were identified. These discrepancies and instances of noncompliance include: inconsistent or missing information regarding where HAPSITE® data were collected; chains of custody forms that were illegible due to improper error correction practices; omission of sample times and dates from chain of custody forms; inconsistent information recorded on electronic field forms and field logbooks; and sample receipts and analytical run logs that were absent from the laboratory data reports. Due to these discrepancies, noncompliance with the QAPP, and the ongoing evaluation of the validity of the 2015 VI data, thirteen of the previously evaluated structures will undergo confirmation sampling.

The confirmation samples will be collected per the planning documents listed above, but utilizing a "limited VI protocol" that includes HAPSITE® screening of indoor air to identify potential interior background sources (no pressure cycling) and collection of up to two 24-hour SUMMA canister samples per structure. Soil gas and ambient air samples will not be collected. Other components of the VI protocol (FE 2015a), such as detailed building surveys, will not repeated. Instead, an abbreviated interview and building survey will be performed to identify any major changes that could affect the

sampling and data evaluation (recent remodels or household chemical storage, for example). Attachment 1 presents a copy of the "full VI protocol" that conveys, in detail (via text highlights), those steps of the protocol that will be retained in "limited VI protocol" that will be utilized for confirmation sampling. Table 2 lists the number and type of samples to be collected at these thirteen structures and Figure 1 shows the locations of the SUMMA confirmation samples.

As noted, up to two 24-hour SUMMA canister samples will be collected from each structure. The determination of where samples will be collected and conditions under which an additional sample may be warranted is described in the "limited VI protocol" (Attachment 1).

2.2 New Locations for Full VI Protocol

Up to seven new (not previously sampled) structures will be sampled in order to supplement 2015 and 2016 VI data (Figure 1). The additional structures to be sampled within AOU-1 are identified as potential new sample locations on Figure 1 and in Table 2. The samples will be collected per the planning documents listed above utilizing a "full VI protocol" (i.e., Appendix H of the RIWP) that includes pressure cycling monitored with the HAPSITE®. Additionally, if an indoor air screening level is exceeded during the full VI protocol sampling, up to two 24-hour SUMMA confirmation samples will be collected at said structure. Ambient air monitoring and near-slab soil gas analysis will be performed if required per the VI protocol (FE 2015a). A full interview and building survey will be conducted at each location in advance of VI sampling.

3. Analytical

Samples will be collected in individually certified clean SUMMA canisters per QAPP Update Revisions 1 and 2. SUMMA canisters will be sent to ALS Environmental in Salt Lake City, Utah for analysis of target volatile organic compounds (VOCs) via TO-15 selective ion monitoring (SIM) (for preliminary contaminants of potential concern [PCOPC]) or TO-15 (for other target analytes) per Table 7 of the QAPP Update Revisions 1 and 2 (EA 2016a, VA 2017). PCE will be analyzed via TO-15 SIM for indoor air samples. QC samples will be collected as specified in QAPP Update Revisions 1 and 2 (EA 2016a, VA 2017). Analytical results will be reported to the lowest achievable method detection limits and reliable quantification levels. Once results are received from the laboratory, data will be validated in accordance with the QAPP Update Revisions 1 and 2 (EA 2016a, VA 2017).

4. Quality Assurance

Additional QA protocol will be implemented in order to ensure supplemental sampling data will achieve project data quality objectives. During the first week of VI sampling, the US Army Corps of Engineers will provide oversight in the field and an in-person meeting with the contractor, regulators, and VA will be conducted to review field documentation for accuracy and completeness. Additionally, the VA will routinely spot-check field documentation throughout the sampling event. If any noncompliance issues are identified, then field audits and meetings will continue weekly until which time the issues are resolved.

In an effort to ensure that field documentation is performed in accordance with the QAPP and SAP, a pre-field kick off meeting will take place with the field staff to discuss all field documentation and to discuss the requirements of the QAPP and SAP. A daily QA checklist (Attachment 2) to monitor compliance with the QAPP will be completed. Once field work has commenced, the Project Manager will be responsible for ensuring field documentation is performed in accordance with the QAPP and SAP.

The field documentation for confirmation samples collected via Limited VI Protocol will consist of:

1. **Field Logbook**: The field logbook will contain all of the field notes specific to each residential limited VI protocol sampling event (i.e., HAPSITE® calibration information, time of arrival/departure, brief floor plan sketch with sampled locations, whether or not an interior source(s) was identified with the HAPSITE®, product manufacture name and its location, SUMMA deployment time, location, initial/final vacuum, canister/flow controller ID, Sample ID, etc.). This will be a Rite in the Rain® notebook with numbered pages.

2. **HAPSITE® Field Form**: HAPSITE® field forms will be used to log each HAPSITE® sample (run number, time, date, location, location description, sample ID, and detected VOC concentrations). One form will be dedicated to each sampled residence. HAPSITE® field forms will be spiral bound in booklet form.

3. **SUMMA Field Form**: SUMMA field forms will be used to log each SUMMA canister deployment. These forms will include the following information: sample location, sample ID, canister/flow controller ID, start/end time, start/end date, initial/final vacuums, flow controller flow rate, etc.). One form will be used per sample location. SUMMA field forms will be spiral bound in booklet form.

The field documentation for new samples collected via the Full VI Protocol Sampling will consist of the same documentation for the Limited VI Protocol with the addition of a pressure cycling field form where blower flowrates and differential pressures will be logged. The SUMMA field form will only be necessary if a screening level is exceeded during the Full Protocol VI sampling, and soil gas samples will be logged on the HAPSITE® field form.

5. Documentation and Reporting

The findings from the 2017 sampling will be summarized in a VI Field Report. Information that may result in the need for actions prior to the VI Field Report will be conveyed to the agencies during the regularly scheduled project-team conference calls.

Key Information and Associated Document
Minor Field Modification #18 to the Remedial Investigation Work Plan
AOU-1: East Side Springs, 700 South 1600 East PCE Plume, Salt Lake City, Utah

Document	Key Information
RIWP	• Project objectives, technical approach, and sample rationale • Appendix E - Risk Assessment Work Plan for identification of PCOPCs • Appendix H - Protocol for Performing Indoor Air and Near-Slab Soil Gas Assessments • Appendix I - Project Communications Plan for Contractor Field Staff
QAPP Update Revision 1 and 2	• Data quality, precision, and accuracy objectives • Required training and documentation • Target analyte list, laboratory analytical methods, quantitation limits, and SOPs • Instrument maintenance and calibration • Required quality control samples • Corrective action requirements • Data validation requirements
SAP (Appendix A of the RIWP)	• Sampling methodology and procedures, sample handling, sample designations, and sample documentation • Sample custody requirements • Field SOPs • VI field screening instrument instructions and HAPSITE® Operators Manual
Minor Field Modification #1	• Changes in the order of various components of the indoor air screening process (“full VI protocol”)
Minor Field Modifications #3 and #7	• Indicates analysis of PCOPCs, including 1,4-dioxane, to be completed by TO-15 SIM. TO-13 analysis is no longer required. • This field modification is a change to sections 6.2.1.3 and 6.2.2.2 of the RIWP and 4.1 and 4.2 of the SAP.
Minor Field Modifications #4 and #8	• Replaces Section 6.2.1 Indoor Air Quality Assessment of the RIWP and Section 4.1 Indoor Air Quality Screening, Characterization, and Verification of the SAP with QAPP Update Revision 1 and 2 Section 2.3.1. • Replaces Section 6.2.2 of the RIWP and Section 4.2 of the SAP (i.e., Near-Slab Soil Gas Investigation) with QAPP Update Revision 1 and 2 Section 2.3.2. • Replaces Section 6.2.3 of the RIWP and Section 4.3 of the SAP (i.e., Open-Field Soil Gas Investigation) with QAPP Update Revision 1 and 2 Section 2.3.3.
Minor Field Modification #5	• Replacement of the Health and Safety Plan (Appendix C of the RIWP) to reflect the health and safety protocols specific to EA Engineering, Science, and Technology, Inc. • Assesses the risks associated with potential and actual health and safety hazards and identifies those controls to be implemented during investigation activities.

NOTES:
PCOPC = Preliminary contaminants of potential concern.
QAPP = Quality Assurance Project Plan.
RIWP = Remedial Investigation Work Plan.
SAP = Sampling and Analysis Plan.

New structures (supplemental data using "full VI protocol")	0057-H	X		X	X	X	X	
	0058-H	X		X	X	X	X	
	0059-H	X		X	X	X	X	
	0060-H	X		X	X	X	X	
	0061-H	X		X	X	X	X	
	0062-H *	X		X	X	X	X	
	0063-H *	X		X	X	X	X	

NOTES:
(1) = TO-15 confirmation samples will only be collected at full VI protocol structures (new structures) if an residential indoor air screening level and/or soil gas screening level is exceeded during full VI protocol sampling. TO-15 indoor air confirmation samples will be collected at all limited VI protocol structures (previously sampled structures).
* Tentative locations pending signed access agreements
ID = Identification.
VI = Vapor intrusion.

2017 Proposed SUMMA Confirmation Sample Locations

Potential New VI Sample Locations

Potential VI Data Gap

Label Explanation:
Red labels: Indicate approximate location of indoor air survey conducted in 2015
Grey labels: Indicate approximate location of 2016 confirmatory air sample
Blue lables: Indicate approximate location of indoor air surveys conducted in 2016

**Circles demonstrate approximate location of sample. The location of the label within each circle should not be interpreted as the specific location of where the sample was gathered rather, the sample is somewhere within that circle.*

Labels attached to black arrows indicate general direction of site not located on map

PREFACE

Limited Protocol for Performing Indoor Air Assessments ("Limited VI Protocol")

The attached document, *Protocol for Performing Indoor Air and Near-slab Soil Gas Assessments* (i.e., referred to as the "full vapor intrusion (VI) protocol" herein, and dated 17 July 2015), was included as Appendix H of the Accelerated Operable Unit 1 (AOU-1) Remedial Investigation Work Plan (RIWP). This document has been included in its entirety (below) to illustrate those steps from the "full VI protocol" that will be performed as part of the "limited VI protocol" noted in Minor Field Modification (MFM) #18. Steps that are highlighted in yellow in the "full VI protocol" constitute those items that are retained as part of the "limited VI protocol".

In addition, MFM #1, #2, #3, #4 and #8 represent approved changes to the "full VI protocol" and shall be reviewed prior to implementing the protocol. For example, since approval in July 2015, the following changes have been made to the "full VI protocol":

- The order of HAPSITE® operations to screen structures for indoor background sources was updated to begin with the use of analyze mode to identify indoor spaces with elevated concentrations of volatile organic compounds (VOCs). Followed by the use of survey mode to positively identify suspect indoor background sources of VOCs. (MFM #1, #4, and #8 [Attachments 1A – 1C, respectively]).

- Vinyl chloride is no longer a reported HAPSITE® analyte based on 2015 TO-15 sample results (MFM #4 and #8 [Attachments 1B and 1C, respectively]).

- Soil gas samples for TO-15 analysis will only be collected if measured PCE soil gas concentrations exceed the 370 micrograms per cubic meter ($\mu g/m^3$) (55.4 parts per billion by volume [ppbv]) screening level (SL) (QAPP Revision 2 [Department of Veterans Affairs (VA) 2017]).

- No soil gas samples will be analyzed using method TO-13 per the approved MFM #3 (Attachment 1B).

Where clarifications to the protocol based on previously approved minor field modifications are included in the text of the protocol, the clarifications are identified by bracketed red, italicized text so that the reader understands these are approved changes from the original approved protocol (standard black font).

FINAL

Protocol for Performing Indoor Air and Near-slab Soil Gas Assessments
700 South 1600 East PCE Plume Superfund Site
Salt Lake City, Utah

PREPARED FOR: D. Lynne Welsh/VA Salt Lake City Health Care System

PREPARED BY: Scott Beckman and Ed Reid, First Environment, Inc.

COPIES: David Waite, CH2M-Hill; Rolf Lange, Avalon; Devin DeMarco, First Environment, Inc.

DATE: July 17, 2015

1.0 Introduction

This document provides a protocol for the use of real-time on-site gas chromatography/mass spectrometry (GC/MS) analysis to screen for indoor sources, identify potential points for vapor intrusion, screen for the presence of volatile organic compounds in soil gas and indoor air, and direct 24-hour SUMMA canister sampling at selected locations (with TO-15 analyses) to evaluate the potential for vapor intrusion in structures associated with the Accelerated Operable Unit-1 (AOU-1) portion of the 700 South 1600 East PCE Plume (Plume).

The AOU-1 Remedial Investigation will involve an assessment structure including residential, commercial, and public buildings within the Study Area. The objectives of the investigation are several-fold:

- Determine, using real-time indoor air sampling via portable laboratory equipment and confirmatory EPA TO-15 analyses for volatile organic compounds (VOCs), if there is an immediate threat to human health in structures associated with the Plume.
- Expedite the indoor air assessment using real-time data from a field-portable GC/MS to identify indoor sources and identify potential vapor intrusion points during negative depressurization followed by positive pressurization of the entire structure or key discrete portions, as determined practical in the field.
- Collect indoor and near-slab soil vapor data as part of a collaborative data-set that will support the overall remedial investigation of both the groundwater plume and vapor intrusion potential, development of a periodic indoor air monitoring program for AOU-1, future risk assessment, and refinement of the conceptual site model.
- Determine the relationship between a subset of co-located TO-15 grab samples and field-portable GC/MS air sample results for determining the comparability of the field instrument to provide acceptable and usable real-time data.

This vapor intrusion investigational approach was adopted from an Environmental Security Technology Certification Program (ESTCP) Project No. ER- 201119-Final Report (GSI, 2013) and ER-201119-GD- Standard Protocol (GSI, 2014) and provides an alternative to the conventional investigation method of indoor air and sub-slab testing. The project-specific Quality Assurance Project Plan (QAPP) and Sampling and Analysis Plan (SAP) (including

Standard Operating Procedures (SOPs) for HAPSITE preparation and general operation) were also used as references for this Protocol, as well as the Infinicon HAPSITE Smart Plus™ and HAPSITE-ER™ Operating Manuals.

The Protocol relies on the use of on-site data acquisition of indoor air volatile organic contaminants and near-slab soil gas using field portable gas chromatography/mass spectrometry (GC/MS) for real-time assessment of structures. The protocol also provides a methodology for locating and quantifying sources of indoor air contamination should indoor air contaminants be identified during the assessment process. For this study, the field portable instrument will be the HAPSITE Smart Plus™ or HAPSITE ER Chemical Identification System™ (HAPSITE). Indoor air constituents detected above initial action screening levels proposed by the Department of Veterans Affairs (VA) will be confirmed by conventional 24-hour SUMMA canister sampling. The SUMMA canister samples will be analyzed using Environmental Protection Agency (EPA) Method TO-15 Select Ion Monitoring (SIM) and TO-15 laboratory analyses by a National Environmental Laboratory Accreditation Program (NELAP)-certified off-site laboratory.

The following activities will be performed as part of the protocol. Real-time assessment using the HAPSITE™ will determine the nature and applicability of specific activities. For AOU-1, the decision criteria are contained in the technical memorandum: Vapor Intrusion Screening Levels and Removal Action Levels 700 South 1600 East PCE Plume, Salt Lake City, Utah dated 10/17/2014.

- Selection of Structures for Vapor Intrusion Assessment (Section 3.0) – selection of structures to be included in the Remedial Investigation.
- Pre-Assessment Activities (Section 4.0) – confirmation of access agreements/ permissions, schedules, and address for testing; property owner/occupant review of questionnaire for locating potential indoor air background sources; and building condition assessment for sampling locations.
- HAPSITE™ Use, Calibration and QC Checks (Section 5.0) – use and operation, initial calibration; continuing calibration and tuning checks, overnight storage, and regular maintenance.
- Outdoor (upwind) Real-time Qualitative Sampling (Section 6.0) - conduct ambient outdoor (background) testing at an upwind location adjacent to the structure using the HAPSITE ™ in analyze mode to identify presence of target VOCs.
- Initial (upon entry) Survey of indoor VOC Concentrations/Identification of Interior Background Sources (Section 7.0) – room-by-room (or groups of room openly connected) walk through of the structure using the HAPSITE™ in survey mode to identify the presence of any elevated VOC concentrations, followed by localized (sub-areas of rooms) assessments as indicated by initial results to identify and record locations of interior background sources.
- Survey of Potential Vapor Intrusion Entry Points (Section 8.0) – areas identified during initial building condition assessment inspection to assess for vapor entry points using HAPSITE™ in survey mode.
- Initial Real-Time Quantitative Sampling (Section 9.0) – under ambient conditions, interior floor-by-floor and (if necessary) room-by-room quantitative assessment of target chlorinated VOCs: Tetrachloroethylene (PCE); Trichloroethylene (TCE); cis-1,2-Dichloroethylene **(**cis-1-2-DCE); and, Vinyl Chloride (VC). *[Note that VC has been*

removed from the HAPSITE® analyte list per approved MFM #4 and #8 (Attachments 1B and 1C, respectively).]

- Negative Pressure Real-Time Quantitative Sampling (Section 10.0) – place the building interior, or if the structure is divided into discrete areas, the portion of the building interior identified as having the greatest potential for vapor intrusion, under negative pressure, and conduct continuous (repeated samples at a central location) quantitative sampling for target chlorinated VOCs during initial depressurization and air exchange, followed by quantitative sampling using the HAPSITE™ on all other floors while building is under negative pressure.
- Positive Pressure Real Time Quantitative Sampling (Section 11.0) – place the building interior, or if the structure is divided into discrete areas, the same portion of the interior where depressurization was previously performed, under positive pressure and conduct continuous (repeated samples at a central location) quantitative sampling in the same locations and sampling procedures as used during the negative depressurization.
- SUMMA Canister Sampling (Section 12.0) – SUMMA™ canisters (24-hour samples) deployed after interior background source are identified and after quantitative HAPSITE™ sampling under ambient and negative pressure, if data indicates exceedances of the established risk action screening levels for any analyte.
- Near-Slab Real-Time Soil Gas Sampling (Section 13.0) – perform real-time, near-slab soil gas quantitative evaluation of contaminants of interest using the HAPSITE™ in analytical mode. Collect SUMMA canister samples at selected sampling probe locations adjacent to structures where indoor SUMMA™ canisters were collected, plus at least two soil gas locations without detectable COCs in soil gas.
- Data Management and Distribution (Section 14.0) – data management and distribution to project participants.

2.0 Problem Definition

A PCE plume (Plume) has been detected in the vicinity of the George E. Wahlen VA Medical Center (VAMC or Facility). The Plume underlies the neighborhoods surrounding the intersection of 700 South and 1600 East in Salt Lake City, Utah, a blended commercial and residential area of approximately 300 acres. PCE was detected at parts per billion (ppb) levels in one of Salt Lake City's secondary drinking water wells (removed from service in 2004) and the Mt. Olivet Cemetery irrigation well. PCE has also been detected at ppb levels in shallow and deep groundwater, surface water springs, and in storm sewers in this area.

VA subsequently designated the primarily residential area on and just below the Wasatch Fault Scarp as AOU-1, also known as the East Side Springs area. This area is characterized by numerous small seeps and springs, some of which discharge PCE-containing groundwater to the land surface near the suspected downgradient margin of the PCE plume. The residential areas just to the north of AOU-1 and a dry gulch just to the east of AOU-1 are included in AOU-1. The northernmost and easternmost portions of AOU-1 are not currently known to contain springs or seeps, and the depth-to-groundwater beneath the surface is not known. However, the proximity of these areas to the groundwater table and springs containing PCE warrant further study to determine whether any subsurface contaminants related to the Site extend to those areas and pose risks to human health and/or the environment.

The primary public health concern within AOU-1 is the potential for vapor intrusion of chlorinated volatile organic compounds, associated with the Plume, into surrounding homes, schools, and other structures in the East Side Springs area. The potential public health threat is the accumulation of volatilized PCE and its degradation by-products from contaminated groundwater into proximal occupied structures above regional screening levels; thus creating an inhalation exposure hazard. The potential pathways for PCE (and associated degradation products) into indoor air may include the surrounding or underlying soil gas, surface water springs, and shallow groundwater in the vicinity of the structure or dwelling.

This protocol outlines performing real-time and conventional indoor-air assessment of structures associated with the East Side Springs in order to rapidly assess excess risk associated with contaminated indoor air resultant of VI and to obtain legally defensible data for future mitigation decisions.

3.0 Selection of Structures for Remedial Investigation Initial VI Assessment

Prior to field-activities, the VA and technical team will coordinate the solicitation of property owners for voluntary testing of their property for VI assessment. VA plans to approach the 50 or so property owners that have already indicated a willingness to allow testing and pending access permission, structures on these properties will constitute the initial group of buildings to be tested for potential vapor intrusion. VA's goal is to identify a sufficient number of structures within the known location of the Plume and outside the Plume that may exhibit a full-spectrum of indoor air vapor concentrations for the contaminants of interest. Of the 50 or so properties to date where owners have volunteered for testing, some are located within the approximate known areas of the Plume where PCE detections in the surface springs were encountered, some are above the Plume in areas where groundwater is at least 30 to 50 feet below the surface, some are located over shallow groundwater that is outside the Plume, and some are located a considerable distance from the known Plume extent and well above the groundwater table.

The rationale for testing a range of locations within the Remedial Investigation Area is to: (1) maximize the probability of encountering structures with a spectrum of measurable concentrations of the contaminants of interest in the known impact areas; and (2) maximize the probability of encountering some structures with no or minimal levels of the contaminants. The combined data-set will be used as an early guide to recruit additional sampling locations and prioritize the recruitment based on potential for vapor intrusion.

4.0 Pre-Assessment Activities

Pre-assessment activities include the following: (1) confirming that an access agreement/permission of the property owner is in place, confirming the schedule for the investigation, and the structure's address; (2) reviewing questionnaire responses in order to evaluate potential indoor air background sources; (3) identifying indoor air sampling locations and evaluating the structural conditions that may affect vapor intrusion; and (4) noting the locations of background sources (to the extent possible) of materials containing chlorinated volatile organics. The activities noted for 1, 2, and 3, above, may be done in advance of the arrival of the sampling team whenever possible. Removal of significant background sources, including non-target sources such as gasoline or paint thinners that are likely to potentially overwhelm the field instruments, will be discussed with owner upon arrival and removed from

the structure with their permission to the extent possible. For this effort, the assessment team will consist of two individuals, at least one of which is trained and certified by the equipment vendor on the use of the HAPSITE.

4.1 Confirmation of Access Agreements, Schedules, and Addresses

Prior to arriving at the testing site, the assessment team will confirm with the VA that permission for access is in place, the scheduled date and address are correct, and a responsible party will be at the building to grant access and provide pertinent information. For the day of the assessment, upon arrival of the sampling team, the property owner will be asked to close all windows, exterior and interior doors, and shut off any forced air climate control equipment for the duration of each sampling task that requires no air circulation (i.e., indoor source survey and entry point survey, negative depressurization). Between sampling tasks and during personnel breaks or lunchtimes, forced air climate controls can be restarted to maintain indoor temperatures. Homes with baseboard electric heat or hot-water radiator heat do not require systems to be turned off.

4.2 Review of Building Questionnaire Responses

A questionnaire will be filled out by the property owner or building occupant prior to on-site assessment and reviewed by the assessment team. The questionnaire will include information regarding the layout of the structure (e.g., number of floors, approximate square-footage, rooms on each floor, attached structures); and the type and location of potential background sources (dry cleaning, glues, solvents, fuels, cleaning products). This information will be used to (1) identify initial sampling locations; and (2) locate and document any potential background sources prior to conducting any screening or sample collection.

4.3 Building Survey

Upon arrival at the building, if the structure was not able to be inspected and the layout obtained prior to the sampling date, the assessment team will perform a walk-through to confirm the layout of the structure. The assessment team will sketch a floor plan layout showing each room on each level with approximate dimensions of each room. Any obvious interior background sources identified from the questionnaire or during the walk-through will be documented as to the type of product and its location within the structure. Unless the source is creating high concentrations of indoor VOCs that will overwhelm the HAPSITE™, all identified background sources will be left in place. The potential source and location will be recorded on the sampling record, as well as the presence of any fixed sources that cannot be removed such as new carpet, freshly painted surfaces, etc. From the building survey, initial quantitative sampling locations will be marked on the layout sketch. These initial locations shall be, at a minimum, on every level and generally centered within the level.

5.0 HAPSITE™ Use, Calibration, and QC Checks

5.1 HAPSITE™ Use

The HAPSITE™ will be operated by a KD Analytical Trained and Certified assessment team member. The trained assessment team member will be familiar with the general use of the instrument, as well as with the project specific measurements and QC requirements.

The HAPSITE™ will be used in two modes - Quantitative Analyze and Qualitative Survey. In Quantitative Analyze mode the instrument will detect and quantify the target chlorinated VOCs: PCE, TCE, cis-1,2-DCE, and VC. The sensitivity of the HAPSITE™ for chlorinated VOCs in

Analyze Mode is 0.1 to 0.5 µg/m3, which is below the characterization criteria (EPA RSLs; in parentheses) for PCE, but close to the criteria for the other selected target analytes: PCE (11.0 µg/m3, TCE (0.48 µg/m3), VC (0.17 µg/m3), and cis-1,2-DCE (no value established by EPA). In Qualitative Survey Mode the instrument will be used as a screening tool for the continuous-reading of the target analytes. The sensitivity of the HAPSITE ™ for the target analytes in Survey Mode is in the low mg/m3 range. Survey mode will be used to assess the location of background sources from indoor products and materials, as well as determine potential entry points for subsurface vapor contaminants.

For the Analyze Mode, a project-specific sample intake and analysis method has been developed for the HAPSITE™ by the operator focusing on the target analytes: PCE, TCE, cis 1,2-DCE, and VC. The selective ion monitoring (SIM) mode will be used to increase the detector sensitivity for the target analytes. The customized method for the HAPSITE™ will include selecting the characteristic ions for each compound targeted, the temperature settings, GC temperature profiles, including ramp times and rates, and the timing and mass measurements associated with each scan set in the method. The equipment vendor is providing the method programming pre-installed as a selection option on the HAPSITE™. These parameters can also be modified or reset according to manufacturer instructions provided in the HAPSITE™ Operations Manual (included as an attachment to the SAP). The method will be designed for low concentration samples (i.e., 0.1 – 10 ppbV range). However, if high concentrations are encountered (e.g., 100 – 1,000 ppbv), the method can be modified simply by reducing the sampling duration – effectively diluting the sample and raising the lower quantification limit for any lower concentration VOCs.

In the Survey Mode, the HAPSITE™ by-passes the GC column and sends a continuous sample directly to the mass spectrometer detector. Survey mode for this project will be used to continuously search for indoor background generating materials and for screening potential entry points for subsurface vapors. For the Survey Mode, the HAPSITE™ is carried from room to room and the concentrator probe placed near a suspected source or near potential vapor intrusion points (e.g., foundation cracks) to identify concentrations of VOCs, as further discussed below. *[Note that the order of HAPSITE® operations were updated in MFM #4 and #8 (Attachment 1B and 1C, respectively). The indoor air will be analyzed for VOCs using the field portable GC/MS in quantitation mode. Screening will be conducted on each level (basements and living/working floors). If VOCs are detected, the portable GC/MS will be run in survey mode to aid identification of background sources of VOCs such as chemical products and dry-cleaned clothing. If such sources are found, the resident will be asked to relocate the materials from the occupied structure to prepare for real-time air assessment (MFM #4 and #8 (Attachments 1B and 1C, respectively)).]*

5.2 Calibration and QC Checks

For the Analyze Mode, tuning, initial calibration, continuing calibrations, and QC checks will be performed to assure that the instrument meets the data quality objectives specified in the Quality Assurance Project Plan.

Prior to the analyses of any samples, blanks, or calibration standards in Analyze Mode, the instrument performance check (tuning check) will be performed to establish that the HAPSITE™ meets the mass spectral ion abundance criteria. The instrument tuning check (also known as the continuing calibration verification; CCV) gas will be analyzed initially following the calibration of the HAPSITE™ and once per 24-hour time period of operation. In the event the instrument performance check standard does not meet criteria, the HAPSITE™ will not be used in Analyze mode until corrections (including recalibration) are made in

accordance with the Operators Manual, however, the Survey Mode may be used to look for the selected ions of the chemicals of interest.

The HAPSITE™ will be calibrated using a minimum of five chemical concentrations that span the monitoring range of interest (0.1 ppbv to 100 ppmv) in an initial calibration sequence to determine instrument sensitivity and the linearity of GC/MS response for the target compounds (PCE, TCE, cis-1,2-DCE, and VC). QA criteria for calibration curve acceptability are: Relative Standard Deviation (RSD) <20%; RSD of RF < 30%; and curve fit R-Squared (R^2) ≥ 0.98, where the RSD % is the measure of the linearity of the concentration levels (ion counts) in the calibration curve for each compound; and the Relative Standard Deviation of the Response Factor (RSD of RF %) is the measure of the linearity of the response factors for each compound in the calibration curve, where the response factor is a measure of the relative response (ion count) of an analyte compared to that of an internal standard. Calibration will be conducted in accordance with the procedures described in detail within the HAPSITE™ Operation Manual attached to the SAP. R^2 is the coefficient of determination or correlation coefficient squared and measures variation in the y variable attributable to the x variable. In the case of instrument calibration, this is the instrument reading relative to the known concentration of a calibration standard.

Prior to the daily analysis of samples and blanks, but after tuning criteria and initial calibration have been met, the initial calibration of the GC/MS system must be routinely checked by analyzing a continuing calibration verification (CCV) standard to ensure that the instrument continues to remain within control limits. The CCV standard will be performed once every 24 hours.

The initial equipment checks and QA analyses will be performed using a project-specific method and calibration library provided onboard the instrument. If the QA results fall outside of the desired performance goals, the instrument will be recalibrated.

In the event a sample concentration overwhelms the HAPSITE™ (i.e., concentrations completely saturate the detector as indicated by analytical results), the instrument will require purging of the analytical system with nitrogen in accordance with the Operators Manual to clean the detector before the next sample can be analyzed. Purging shall continue until the instrument results (blanks) indicate the no carry-over concentrations remain.

5.3 Storage and Routine Maintenance

The HAPSITE should be stored in a climate-controlled, dry location where it can be plugged into a stable power outlet and left in “Stand-by” mode – even over weekends. The use of Stand-by mode maintains the system temperature and carrier gas pumps and preserves the system calibration so that daily startup times are considerably shorter. A properly stored HAPSITE in standby mode can maintain its reliability and calibration for up to a month.

The routine maintenance schedule of the HAPSITE is described in the QAPP and in the Operators Manual. Key maintenance includes switching tuning standard cylinders and performing self-test programs before beginning sampling. The internal power source (battery) for the HAPSITE™ provides only two to three hours of operation time and, except when using the instrument in Survey Mode, the HAPSITE should be placed on the floor or on a cart and connected to external electrical 110 Volt AC power.

6.0 Outdoor Real-time Qualitative Sampling

After confirming that the HAPSITE™ meets tuning and continuing calibration requirements, and upon arrival at a testing site, the HAPSITE™ shall be operated in Analyze Mode to collect an ambient outdoor background sample. The sample is acquired in order to define the ambient (outdoor) concentration of the target VOCs.

The outdoor quantitative sampling should be conducted upwind, but within 10 to 30 feet of the structure to be assessed. The sample is collected upwind of the building at a height of approximately three to five feet above the ground surface (approximating the breathing zone). Outside weather conditions shall be recorded including temperature, barometric pressure, wind direction, and an estimate of wind velocity (categorical).

7.0 Identification of Interior Background Sources

Consumer products and household items are commonly found to be significant sources of chlorinated VOCs in indoor air (see Table below).

CHEMICAL[1]	GENERAL CATEGORIES
1,2-DCA	Molded plastic products, air fresheners
Carbon Tetrachloride	Aerosol cans, refrigerants, dry cleaned clothes, varnish
Chloroform	Dry cleaned clothes, fire extinguishers, adhesive remover, chlorinated drinking water
PCE	Dry cleaned clothes, automotive brake cleaners, metal degreasers, hobby craft glue
TCE	Self-defense pepper spray, degreaser, rug-cleaners
Trans-1,2-DCE	Taxidermy foam, refrigerants, cleaning solutions
1,1,1-TCA	Cleaners, adhesives, aerosol cans

1) Data sources: U.S. Department of Health and Human Services. Household Products Database. 2012.

After collecting a quantitative outdoor ambient background sample, the HAPSITE™shall be switched to operate in Survey Mode inside the building to identify the presence of any elevated VOC concentrations. The initial indoor survey should be conducted by walking through the structure room-by-room (or groups of openly connected rooms) while holding the HAPSITE™ probe at waist level and observing instrument responses (ion count). The initial room to room survey will be followed by localized (sub-areas of rooms) assessments as indicated by initial results to identify and record locations of interior background sources.

The indoor source identification procedure involves using a combination of continuous-read qualitative analysis in survey mode, visual inspection, and isolation. In continuous-reading survey mode, the instrument is used to scan potential sources for the specific target analytes. In survey mode, scan near storage units (e.g., cabinets, closets, storage containers, etc.) and product containers found in the room(s) with the highest concentration of the target VOCs detected during the initial survey and quantitative testing. As the potential source area is approached, the ion counts on the instrument will increase. If an instrument response is observed for a storage unit such as a cabinet or drawer, with permission of the property representative, examine the unit for products or materials. Examine the product labels to see if

the target VOC is identified on the label and note the type of product on the sampling record. Do not remove the products, return the unit to its as found condition, and proceed with the assessment. If permission is not granted to inspect a storage unit, the area will be noted as a possible source of background contamination. *[Note that the procedures outlined in the previous two paragraphs have been updated in MFM #4 and #8 (Attachment 1B and 1C, respectively). The indoor air will be analyzed for VOCs using the field portable GC/MS in quantitation mode. Screening will be conducted on each level (basements and living/working floors. If VOCs are detected, the portable GC/MS will be run in survey mode to aid identification of background sources of VOCs such as chemical products and dry-cleaned clothing. If such sources are found, the resident will be asked to relocate the materials from the occupied structure to prepare for real-time air assessment (MFM #4 and #8 (Attachments 1B and 1C, respectively)).]*

Locations of identified indoor sources will be recorded on the electronic sampling forms and rooms with elevated VOCs not tied to an indoor source shall be noted for further investigation for vapor intrusion points.

8.0 Survey of Potential Vapor Intrusion Entry Points

Areas identified in the initial VI assessment inspection and during the initial walk-through of the structure for potential vapor intrusion entry points will be assessed using the HAPSITE™ in survey mode. The vapor intrusion entry survey will be concurrent with the indoor source survey to the extent practical.

The instrument will be used to scan potential vapor entry points such as sumps, floor drains, expansion joints, plumbing penetrations, or foundation cracks. The sampling port is placed near the potential vapor entry point. If the ion counts increase in the vicinity of the entry point, then there is evidence that there is a vapor intrusion problem. In addition, any VOCs identified by type by the instrument will be recorded. The particular room (or rooms) shall be further evaluated in quantitative mode under depressurization conditions.

9.0 Initial Real-time Quantitative Sampling

After the initial Survey for indoor background and vapor intrusion points for target VOCs has been completed, the HAPSITE™ shall be switched to Analyze Mode to conduct real-time quantitative indoor air sampling and analysis (under ambient pressure conditions). Based on the structural assessment, floor plan of the structure, and Survey Mode results, an initial indoor sample for quantitative analysis will be collected from the three to five foot high breathing zone interval in each major floor level within the building; for example, the basement, main floor, and second floor of the structure. Additional samples may be collected from potential indoor source areas such as an attached garage and from specific rooms where the initial survey indicated evidence of elevated VOCs.

If the concentration of the target VOCs in all areas is below detection limits or below the screening action level concentrations, then it can be concluded that there are no significant background sources of indoor air contamination. The assessment then proceeds to performing an indoor air assessment under negative pressure conditions (Section 10.0). If target VOCs in one or more major areas are detected above screening levels, then a more detailed quantitative assessment is performed to determine the specific rooms associated with the areas exhibiting the highest concentrations. For example, if the VOC concentrations from the first round of sampling were highest in the basement, each room in the basement would be

sampled in quantitative mode.

10.0 Negative Pressure Real-Time Quantitative Sampling

Building depressurization (negative pressure) can exacerbate a vapor intrusion problem and may be a conservative means of detecting vapor intrusion within a structure. The structure will be placed under a stable differential pressure of -5 pascals using a variable speed louvered air door installed in a doorway located at the lowest possible level at the structure. A recording digital manometer will be used to measure the indoor versus outdoor pressure differential and the structure will be maintained under negative differential pressurization for 30 minutes (or until at least 2.5 air exchanges have occurred) before initiating sampling. The louvered air door to be employed in the depressurization will be capable of exhausting up to 6,000 cubic feet per minute of air; however, depending on construction tightness of the structure, particularly in homes built prior to the 1970s, air leakage into the home may not allow attaining of the -5.0 pascal target depressurization level. In this case, testing will proceed as long as any differential depressurization can be achieved. In the event the structure does not achieve a one pascal depressurization relative to the outdoors, this will be taken as an indicator that the structure construction is so leaky with respect to outdoor air that depressurization does not naturally occur and will be noted on the sampling forms, and the sampling will continue to verify that no increases in concentrations occurred..

The HAPSITE™ will be deployed in Analyze Mode in a high-risk location (defined as the lowest living or occupied level of a structure and where vapor intrusion is most likely to occur) immediately prior to the start and operated continuously (one sample every eight minutes or as often as instrument cycling allows) during negative pressurization until the 2.5 air exchanges have been attained. Upon achieving conditions stated above, additional quantitative sampling will be performed on every level of the structure, in the same locations used during the ambient characterization. If the previous entry point screening using the HAPSITE™ in Survey mode identified an area of probable vapor intrusion, then a quantitative measurement will be performed in that room while it is under negative depressurization.

It is important to note that the residences and structures to be tested range in size from single floor dwellings to large public buildings and range in age from 30 to over 100 years. In the event that an entire structure cannot effectively be placed under negative pressure due to size, floor plan layout, or extreme air leakage, the blower door will be located to depressurize the lowest level of the structure where vapor intrusion is most likely to occur, as indicated by the previous testing results. The final decision will be made by the field team leader, and the decision rationale noted in the electronic field record.

11.0 Positive Pressure Real Time Quantitative Sampling

Building pressurization (positive pressure) can assist in the differentiation of indoor background sources and actual vapor intrusion. The structure will be placed under a stable differential pressure of +5 pascals using a variable speed louvered air door installed at the same location as used for the negative depressurization discussed in Section 10.0. In addition, if the initial indoor source survey and ambient quantitative analysis results suggest an indoor source on an upper level, the pressurization test will be conducted with the blower door installed on that level. A recording digital manometer will be used to measure the indoor versus outdoor pressure differential and the structure will be maintained under positive differential pressurization for 30 minutes (or until at least 2.5 air exchanges have occurred) before initiating sampling. Testing will proceed as long as any differential pressurization can be achieved. In the event the

structure does not achieve pressurization relative to the outdoors, the building will be assumed to be too leaky to pressurize and any reduction in vapor concentrations is the result of fresh air dilution.

The HAPSITE™ will be deployed in Analyze Mode in a high-risk location (defined as the lowest living or occupied level of a structure and where vapor intrusion is most likely to occur) immediately prior to the start and operated continuously (one sample every eight minutes or as often as instrument cycling allows) once positive pressurization is achieved until the 2.5 air exchanges have been attained. Upon achieving conditions stated above, additional quantitative sampling, at a minimum, will be performed on every level of the structure, in the same locations used during the ambient characterization. If the previous entry point screening using the HAPSITE™ in Survey mode identified an area of probable vapor intrusion, then a quantitative measurement will be performed in that room while it is under positive pressurization.

It is important to note that the residences and structures to be tested range in size from single floor dwellings to large public buildings and range in age from 30 to over 100 years. In the event that an entire structure cannot effectively be placed under positive pressure due to building size, floor plan layout, or extreme air leakage, the blower door will be located to pressurize the lowest level of the structure where vapor intrusion is most likely to occur, as indicated by the previous testing results, and secondly, in the area noted as most likely containing indoor source materials. The final decision will be made by the field team leader, and the decision rationale noted in the electronic field record.

12.0 SUMMA™ Canister Sampling

Laboratory confirmation samples will be collected from structures where any quantitative HAPSITE ambient indoor or quantitative HAPSITE™ depressurization analyses exceed the screening action levels for any target VOC. Sample collection will use a 24-hour composite sample from a SUMMA™ canister and will be analyzed by Method TO-15.

For residences or other occupied buildings meeting this criteria, at least one indoor air sample for lab analysis will be collected per building. This sample will typically be collected in the lowest regularly occupied level of the home (either a finished basement or first floor) in contact with the ground. If the specific construction or configuration of a residence suggests one indoor sample will not be representative, or field-based detections of any contaminant of interest are detected in widely separated multiple locations, then a second indoor air sample may be collected from another living space, working space, or an unfinished basement room, as indicated by HAPSITE™ characterization results. A house or dwelling's heating and cooling systems can be used during the SUMMA™ Canister sampling.

Non-residential structures such as school buildings and businesses will be screened for indoor air sources, vapor entry points, and negative/positive pressurization as described above, and SUMMA™ canister sample locations will be selected based on the uses of the lower levels of the structure or where VI is most likely to occur. In particular, basement level classrooms in school buildings may be tested with SUMMA canisters for lab analysis regardless of the HAPSITE™ results.

In addition, at least three structures that exhibit concentrations below screening levels (including at least one location with no HAPSITE™ detection of target VOCs) will be sampled using 24-hour SUMMA canisters.

The indoor air samples for full laboratory analysis will be collected into laboratory-supplied six-liter SUMMA™ canisters over a 24-hour period, as detailed below:

- A clean and inerted six-liter Summa canister under a 25 in. Hg vacuum equipped with a flow regulator will be placed at a height of three to five feet above the floor in the center of the space to be sampled.
- The flow regulator will be set to collect a 24-hour time weighted sample (approximately 4 ml/min).
- Sampling will be stopped (i.e., the valves closed and the canister disconnected) after about 24 hours once the vacuum reaches about 5 in. Hg).
- The sampling crew will record the sample name, initial and final vacuums, initial and final sampling times, canister and flow controller serial numbers, and other pertinent information on the field sampling summary and laboratory Chain of Custody (CoC) forms.
- Canisters will be packed in a rigid wall shipping container, such as a cooler or heavy-duty cardboard box (ice is not required), if shipping is required.
- A custody seal will be placed over the openings to the shipping container.
- The shipping container will be shipped or delivered immediately to the laboratory for analysis.
- All samples will be accompanied by the CoC as described in the QAPP.

SUMMA™ Canister sampling will be conducted in accordance with the SOPs provided in the SAP.

As an additional confirmation on the accuracy and precision of the HAPSITE™, up to six instantaneous SUMMA™ grab samples will be collected and analyzed for TO-15 parameters in residences where VOCs are detected during the HAPSITE quantitative sampling. The grab samples will be co-located with the HAPSITE™ sample probe and collected by opening the SUMMA™ canister valve to allow the canister to fill concurrently with the HAPSITE sample intake process. The results will represent the VOC concentrations present at a given location at the time of collection and can be correlated compared directly to HAPSITE quantitative results similar to a duplicate sample analysis.

13.0 Near-Slab Real-Time Soil Gas Sampling and Analysis

The near-slab soil gas characterization approach will be implemented concurrent with the indoor air characterization to identify and characterize target VOCs present in soils adjacent to tested structures. The purpose of the soil gas sampling is two-fold (1) provide soil gas concentrations near structure foundations for support of the AOU-1 Vapor Intrusion Risk Assessment pathway evaluation process; and (2) provide information to help define the potential extents of the underlying groundwater VOC plume.

Near-slab soil gas characterization will be performed adjacent (within five feet) to all structures screened and assessed for indoor vapor intrusion. Soil vapor probes will be driven adjacent to the structure's foundation to a depth approximately six inches below the base of the foundation or to the top of the water table, whichever occurs first. Samples will be collected with a peristaltic pump and Tedlar® bags, field screened with a PID and multi-gas meter, then a second sample collected in the same manner and field-screened in real-time with the portable GC/MS in analyze

mode to identify and quantify any target VOCs present in soil pore space adjacent to structures. At locations where groundwater is not encountered at the base of the foundation, after sampling, the probe rod will be driven another five feet, if soil conditions allow, and the sampling process repeated to obtain vertical delineation data for soil gas. If groundwater is encountered, the approximate depth-to-water will be measured and recorded, the probe re-installed to just above the water table, and a soil gas sample collected just above the water level.

Soil gas samples will also be collected in SUMMA™ canisters and analyzed for full volatile organics (TO-15) analysis for any near-slab characterization sample where indoor SUMMA™ canisters are collected. *[Note that MFM #4 and #8 (Attachments 1B and 1C, respectively) state: collect soil gas samples in a Summa canister and submit selected soil gas samples for full volatile organics (TO-15) analysis at a UDOH certified laboratory at any location where a near-slab characterization sample exceeds the 11.0 µg/m^3 (1.62 ppbv) SL for PCE or where soil gas vapors are found to be elevated 10 times the RSL for the detected VOC. Note however, this screening value was corrected to 370 µg/m^3 (54.55 ppbv) in QAPP Revision 2 (VA 2017).]* In addition, three selected locations throughout AOU-1 where the field portable GC/MS did not detect target VOCs in soil gas above screening levels will be sampled. Sampling for laboratory analyses will be accomplished using SUMMA™ canisters equipped with flow regulators to collect 24-hour time-averaged samples from the soil vapor probes.

In addition to confirmatory VOC analyses, five percent of the soil gas sampling locations within the PCE plume area will be selected for additional Semi-Volatile Organic Compound (SVOC) analyses using method TO-13A. Method TO-13A employs laboratory-supplied sorbent tubes attached inline between the vapor probe and a vacuum pump set at a flow rate of 5 L/min for 480 minutes (8 hours). SVOC samples are for informational purposes to support full characterization of the plume nature and extent, and possible future risk assessment of the Site. *[Note that MFM #3 (Attachment 1B) indicates that no samples will be analyzed using method TO-13. Additionally, per MFM #4 and #8 (Attachments 1B and 1C, respectively) soil gas samples for TO-15 analysis will only be collected if soil gas PCE concentrations exceed the 11.0 µg/m^3 (1.62 ppbv) SL or where soil gas vapors are found to be elevated 10 times the RSL for the detected VOC. Note however, this screening value was corrected to 370 µg/m^3 (54.55 ppbv) in QAPP Revision 2 (VA 2017).]*

The procedures for emplacing the soil gas probes, testing the integrity of the seal, and for collecting and analyzing samples both for the HAPSITE™ and the TO-15 Method and TO-13A Method are described in the QAPP (Section 2.3.2) and the SAP (Section 5.4).

14.0 Data Management and Distribution

14.1 Data Management

Information that will be included in the project data record relative to the indoor air study include field log books, sample collection and handling records, operational records, GPS data, chain-of-custody forms sample receipt records, and shipping documentation. Field log books may be kept electronically via hand-held tablets.

The project field team leader will be required to maintain a field logbook of daily activities. A separate logbook of suitable material that will be bound with consecutively numbered pages will be used for this project. All entries will be legibly written in black ink. Any entry errors are corrected by drawing one solid line through the incorrect entry followed by the user's initials and date. The bottom of each page is signed and dated by the individual making the entries. Factual and objective language will be used. All entries will be complete and accurate enough to allow

reconstruction of each field activity. Activities should be recorded contemporaneously.

The field logbook cover will include the following information:

- job name, contract, and delivery order numbers,
- site activity name,
- start date,
- end date of last logbook entry.

Daily entries of the following minimum information will be recorded in the logbook as follows:

- date and time, expressed in 24-hour (military) format;
- sampling start/stop times;
- weather conditions;
- personnel present;
- field observations;
- site identification and building layout (visual sketches where appropriate);
- location of sampling points (GPS coordinates and/or visual sketches where appropriate);
- description of sample;
- sample identification number;
- number of samples taken;
- time of sample collection;
- number of Quality Assurance/Quality Control (QA/QC) samples taken;
- type and mode of field instrumentation;
- names of people collecting samples;
  all calibrations done;
- any other field instruments;
- any general observations or notes;
- any deviations from the sampling plan.

Sample custody will be documented on standardized CoC records, an example of which is included in Attachment 3 of the QAPP. The CoC record establishes the documentation necessary to trace sample possession from time of collection through sample analysis and final disposition. A sample is in the custody of a person if any of the following criteria are met:

- the sample is in a person's physical possession;
- the sample is in a person's view after being in his or her physical possession;
- the sample was in a person's physical possession and was then locked up or sealed to prevent tampering; and/or
- the sample is kept in a secured area.

Field forms including soil gas sampling data sheet, indoor air sampling data sheets, HAPSITE calibration, and QC information will be used during field work. Examples of these forms can be found in Attachment D of the QAPP.

Photographs will be taken in the field to document sampling locations and conditions. Digital camera photographs will be taken with the date/time record turned on. Photographs of all sampling locations will be taken with the sample number. A photographic log will be kept in

which the date, location, photographer's name, and direction the photographer is facing (if appropriate) will be recorded. Photographs will be labeled, placed in a binder or stored electronically, and submitted at the end of the field work. Selected photographs will be used in reports as deemed necessary or appropriate.

14.2 Data Distribution

Data distribution, in the form of reports and memos, are described in the QAPP (Section 4.2) and are summarized below:

- *Weekly Field Status Reports* – Communicates to VA Remedial Project Manager (RPM) weekly progress and any significant preliminary findings, QA/QC issues, and changes to the field schedule.
- *Progress Reports* – Communicates the progress made by VA and its consultants on a monthly basis regarding site investigation, community involvement, achievement of project milestones, and the myriad of actions that encompass the investigation of AOU-1.
- *Environmental Media Reports* – Communicates in brief the conclusions of individual investigation events (Indoor Air, Soil Gas, Surface Water, and Groundwater) for AOU-1 and any laboratory analysis associated with the event. These reports will be written by the Program Manager and submitted to the VA RPM, EPA, and Utah Department of Environmental Quality (UDEQ).
- *Nonconformance Reports* – Identifies any deviations of planned or expected scope-of-work activities relating to the investigation of AOU-1. Reports may pertain to field data collection, health and safety events, etc. These reports will be written by the FET Program Manager or QA Manager. The reports will be submitted to the VA RPM and Quality Assurance Manager, and if needed, the EPA and UDEQ.
- *Laboratory Audits/Corrective Action Reports* – Communicates the result of any third-party audit or review of the analytical laboratory that is supporting the FET investigation activities. This report will be written by the CLP (soil and water media results) and ALS Global Labs (soil gas and air) laboratory designated personnel. The reports will be submitted to the FET Program Manager, VA RPM and Quality Assurance Manager, UDEQ RPM and the EPA RPMs.
- *Remedial Project Managers (RPM) Debriefings* – Weekly conference calls between VA, EPA, UDEQ and other key stakeholders to discuss previous week's field efforts and investigation.
- *Data Validation Reports* – Communicates the results of laboratory data validation for each media (indoor air, soil gas, surface water, and groundwater) to VA, EPA, and UDEQ. Each report will provide a summary of the data validation process, a list of analytes having changed data qualifiers, a list of analytes rejected during validation, and a determination of the usability of the data. The data validation reports will be prepared by the FET lead data validator and the QA/QC Manager.
- *Remedial Investigation Report (RI Report)* – Communicates the conclusions of all investigation events for AOU-1 and any laboratory analysis associated with the event. The RI Report will also contain summaries of data validation reports and deviations from the SAP and QAPP.

RIWP Minor Field Modification-01
Protocol for Performing Indoor Air and Near-slab Soil Gas Assessments
700 South 1600 East PCE Plume Superfund Site
Salt Lake City, Utah

PREPARED FOR: D. Lynne Welsh, VA Salt Lake City Health Care System

PREPARED BY: Ed Reid, First Environment, Inc.

COPIES: David Waite, CH2M-Hill; Rolf Lange, Avalon; Devin DeMarco, Ellen Reid, First Environment, Inc.

DATE: July 17, 2015

Introduction

This document provides a description of a minor modification to the Protocol for Performing Indoor Air and Near-slab Soil Gas Assessments, Version 4.0 (dated December 23, 2014) for the use of real-time on-site gas chromatography/mass spectrometry (GC/MS) analysis to evaluate the potential for vapor intrusion in structures associated with the Accelerated Operable Unit-1 (AOU-1) portion of the 700 South 1600 East PCE Plume (Plume). The protocol is included as Appendix H of the RIWP. The minor modification is a result of lessons learned during implementing the protocol in early January 2015, additional field training with the field-portable GC/MS (HAPSite™), and the initial screening using the protocol at a variety of sites during the first four weeks of the field effort.

The changes to the protocol are primarily changes in the order of various components of the indoor air screening process. In addition, further clarification to the quantitative indoor ambient air testing process to better define the location and number of rooms to be tested per floor level are provided.

Indoor Air Screening Process Modification

The current Protocol provides general procedures in Sections 7.0, 8.0, and 9.0 for conduct of initial qualitative (HAPSite™ in survey mode) screening for indoor background sources, conduct of initial qualitative (HAPSite™ in survey mode) vapor entry point screening, and conduct of quantitative (HAPSite™ in analyze mode) indoor ambient air sampling, respectively. This portion of the testing is done under ambient conditions. Currently, immediately upon entering a site, the HAPSite™ is used to conduct surveys throughout the building to identify potential locations of indoor background source materials and potential locations of vapor entry. Then, based on the surveys, the HAPSite™ is used in analyze mode to quantify concentrations on each floor of the structure and in habitable rooms.

After testing a number of buildings, it is apparent that walking through a site room-by-room with the HAPSite™ in survey mode is inefficient due to the lack of elevated indoor sources above the survey mode detection limits of about 100 ppb in nearly all structures. Below the survey mode

detection limits, the team can only record total ion counts (TICs) relative to baseline TIC to obtain a gross representation of target compounds. In addition, the vapor entry survey has rarely assisted in identifying entry points when random surveys of cracks, wall penetrations, and crawl spaces have been performed in survey mode. Quantitative testing of ambient air has proven to be better at providing initial data that allows the HAPSite™ operator to isolate specific rooms or areas of a site for further evaluation of indoor sources and entry points.

The original Protocol should be changed so that the order of indoor air testing begins with ambient indoor air analysis (Section 9.0) and then proceeds with either indoor background source surveys (Section 7.0) based on ambient results and visual observation of source materials, or vapor entry point surveys based on ambient results and observations of potential entry points.

The regulatory agencies (EPA and UDEQ) verbally agreed to the change on February 5, 2015 and effective upon VA acceptance of the Minor Field Modification, the Protocol is modified so that ambient indoor air analysis will be conducted upon entry into a site. Ambient air samples will be collected and analyzed by the HAPSite from each occupied level of the site and from selected representative rooms or areas on each level. In addition, the operator will collect ambient samples from selected spaces (i.e., closets, utility rooms, and crawl spaces accessed via entry doors from the basement areas) where indoor source materials may be present. Rooms or spaces with notable potential entry points (i.e., large floor cracks, open sump pits, floor drains, exposed sub-slab soil) will also be tested to determine ambient air concentrations within the space.

Upon completion of ambient air sampling and analysis with the HAPSite™, the operator will evaluate the initial ambient results and, in conjunction with visual observations of potential source materials, will switch the HAPSite™ to survey mode and run short (2-3 minute) surveys at locations where indoor sources are more likely to be present, as discussed in the Protocol. TICs will be noted during each survey and the specific item provoking the response also noted, if any. If ambient quantitative data indicates target compounds were below the HAPSite™ detection limits (approximately 0.1 ppbv) and no source materials were observed, then an indoor source survey is not necessary and shall be noted on the VI field forms. If ambient quantitative data shows target compound concentrations just above detection limits from a structure level where only one or two representative samples were initially collected, additional ambient samples will be collected from other locations (at least one other location) throughout that level to verify concentrations do not increase in other portions of the level – as a result of an indoor source.

After indoor source surveys are complete or deemed un-necessary, the operator will use the ambient-results evaluation and previous visual observations of potential vapor entry points to select locations to survey for vapor entry. The HAPSite will be used in survey mode as described in the original protocol and 2-3 minute surveys at suspected entry points (typically sumps, floor drains, foundation wall penetrations, and bare soil crawl spaces). TIC response will be noted and the type of entry and location also noted. If ambient quantitative data indicates target compounds were below or just above the HAPSite™ detection limits (approximately 0.1 ppbv) and no potential entry points were observed, then a vapor entry survey is not necessary and shall be noted on the VI field forms.

MINOR FIELD MODIFICATIONS #3 - #6
Remedial Investigation Work Plan
AOU-1: East Side Springs
700 South 1600 East Street PCE Plume
Salt Lake City, Utah
Approved July 2015

TO: D. Lynne Welsh, Department of Veteran's Affairs

FROM: Pamela Moss, EA Team (EA Engineering, Science, and Technology, Inc., PBC/ CH2M HILL)

DATE: 2 March 2016

SUBJECT: Minor Field Modifications to the Remedial Investigation Work Plan AOU-1: East Side Springs 700 South 1600 East PCE Plume Salt Lake City, Utah (July 2015)

1. Introduction

This document provides a description of minor modifications to the Remedial Investigation Work Plan (RIWP) AOU-1: East Side Springs 700 South 1600 East PCE Plume Salt Lake City, Utah (July 2015) to provide consistency for sampling methods, analytes, and other details documented in the RIWP and the Quality Assurance Project Plan (QAPP) Update Revision 1. Minor Field Modification #1 Protocol for Performing Indoor Air and Near-slab Soil Gas Assessments and Minor Field Modification #2 Clarification of QAPP Amendment Number 1 are included in the Final RIWP as Appendices K and L. The following modifications are detailed below:

- Minor Field Modification #3 – Change of analytical method for analysis of 1,4-dioxane (EPA Crosswalk[1] items A6(a)(iii), A6(a)(vii), B1(b), B1(c), B2(a)(i), B2(b), B2(f)(ii), B2(h), B2(i), B3(a)(i), B3(b)(i), B3(d)(i), B4(b)(i), B4(c)(i), B5(a)(i), B6(b), B7(a)(i), B7(b)(i), B8(a)(ii))
- Minor Field Modification #4 – Updates to the analytical methods, parameters, and the sample media on which the analyses will be performed; updates to number of samples, sample locations and depth, analyses, collection methodology, etc. for each of the targeted media; change in use of HAPSITE gas chromatograph/mass spectrometer for field screening of groundwater and surface water samples (EPA Crosswalk[1] items A6(a)(ii), A6(a)(ix), A6(a)(x), A6(a)(xi), A6(a)(xii), B1(f)(i), B1(f)(vi))
- Minor Field Modification #5 – Update of Health and Safety Plan (HASP) (Appendix C of RIWP)
- Minor Field Modification #6 – Inclusion of isotope analysis of surface water (EPA Crosswalk[1] items A3, A4(a)(iii), A4(e), A6(a)(x), A9(a), B4(a)(ii), B4(f))

2. Minor Field Modifcation #3

The TO-15 SIM analyte list will include 1, 4-dioxane. Therefore, TO-13 sampling and analysis will not be used for any samples collected during the 2016 sampling event. This field modification is a change to sections 6.2.1.3 and 6.2.2.2 of the RIWP.

3. Minor Field Modifcation #4

The following sections and table from the RIWP have been updated for consistency with the QAPP Update Revision 1 with respect to 1) analytical methods, parameters, and the sample media on which the analyses will be performed; 2) number of samples, sample locations and depth, analyses, collection methodology, etc. for each of the targeted media; and 3) change in use of HAPSITE gas chromatograph/mass spectrometer for field screening of groundwater and surface water samples.

Section 6.2.1 Indoor Air Quality Assessment is hereby replaced with QAPP Update Revision 1 Section 2.3.1 as follows:

The indoor air characterization approach is as follows:

- *Indoor Air Screening step: Access each occupied structure within AOU-1 where the occupant/owner has granted access and complete visual inspection for potential indoor VOC sources and conduct resident interview. The indoor air will be analyzed for chlorinated volatile organic compounds (cVOCs) using the field portable GC/MS in quantitation mode. Screening will be conducted on each level (basements and living/working floors. If cVOCs are detected, the portable GC/MS will be run in survey mode to aid identification of background sources of cVOCs such as chemical products and dry-cleaned clothing. If such sources are found, the resident will be asked to relocate the materials from the occupied structure to prepare for real-time air assessment. It is estimated that as many as 300 occupied structures, including residences, schools, daycare facilities, and other businesses, are within the AOU-1 boundaries; however, participation of owners will likely be much less and reduce the actual testing locations, with 30 to 50 structures estimated to be included in the testing.*
- *Indoor Air Characterization step: Conduct real-time assessment of indoor air quality at accessible occupied structures within the AOU-1 area where permission has been obtained. The characterization of indoor air will occur in the breathing zone under both ambient conditions approximately 30 minutes after the indoor source screening step is completed and then after the structure is placed under negative differential pressurization (target differential pressure of 10 pascals, equivalent of 0.04 inches of water, a level that replicates the effects of typical cold season stack effects, between inside and outside) as measured with a portable field manometer. Each structure for which access has been granted within AOU-1will be evaluated for cVOCs, using the portable GC/MS in analyze mode, with testing occurring within the breathing zone on basements and living/working levels of the structure to identify the compounds present in the indoor air. A properly calibrated portable GC/MS in analyze mode is capable of achieving low ppbv to parts per trillion by volume detection limits for PCE and TCE in air. The portable GC/MS will also be used in analyze mode to measure ambient outdoor background concentrations concurrent with the indoor activities. To the extent practical given site access considerations and variable wind directions over the period of sampling, one outdoor air sample will be collected associated with each structure.*
- *Indoor Air Verification step: Conduct indoor air sampling using Summa canisters equipped with flow regulators to collect 24-hour time-averaged samples in structures where concentrations of the 5 PCOPCs exceed the screening levels shown in RIWP Appendix H. Concurrent measurements for differential air pressure (inside and outside) will be taken during this step to*

assure samples are representative of conditions that create vapor intrusion. Samples will be sent to a Utah Department of Health (UDOH)-certified laboratory for volatile organic compound (VOC) analysis or VOC-Selective Ion Monitoring (SIM) analysis to achieve lower reporting limits for PCOCs using the EPA Toxic Organics (TO)-15 analytical method. Laboratory testing of indoor air is estimated to occur at approximately 25 structures out of the 30 to 500 expected to be initially assessed in the AOU-1 area, and analysis of up to 40 indoor samples is expected (some structures will require multiple sample locations). Based on Minor Field Modification #1, an additional 4 structures will be sampled to aid the assessment of whether vinyl chloride is present at concentrations below the detection limit using the portable GC/MS. This is needed because the vinyl chloride reporting limit using the portable GC/MS is above the screening level, whereas, the reporting limit for laboratory samples is below the detection limit. The selected structures will be located where groundwater is within 10 to 20 feet of the ground surface and will include:

- *One sample outside the Plume where PCE, TCE, and cis-DCE in the indoor air are below the screening levels (SLs) or the detection limit of the HAPSITE® instrument.*
- *Three samples will be collected inside the area of the Plume where PCE and TCE are equal to or less than their respective SLs but above the instrument detection limits.*

At least three outdoor (upwind, downwind, and in the center of AOU-1) ambient background samples will be collected during the confirmation sampling activities for laboratory analysis for VOCs using method TO-15.

- *Additional Monitoring Activities: In addition to the initial screening, which will be conducted under cold season and low water table conditions, a second round of assessment and confirmation sampling of indoor air at up to 15 selected outdoor background and indoor air locations, based on the potential for indoor air exposure, will be conducted during Spring 2016. This phase will be conducted in the vicinity of known PCE contamination based on results from the initial sampling. The area of AOU-1 where PCE was previously detected above the screening level in indoor air samples and shallow groundwater is anticipated is known as the focus area. The re-testing will be conducted using both real-time field analyses (portable GC/MS) and confirmatory laboratory analysis using Summa canisters for sample collection and offsite laboratory analysis.*

Section 6.2.2 Near-slab Soil Gas Investigation is hereby replaced with QAPP Update Revision 1 Section 2.3.2 as follows:

The near-slab soil gas characterization approach will be implemented concurrent with the indoor air characterization to identify and characterize cVOCs present in soils adjacent to tested structures, as follows:

Near-slab Soil Gas Characterization step: Conduct soil gas characterization adjacent to structures screened and assessed for vapor intrusion where the property owner agreed to soil gas sampling and sampling is practical given site conditions. Soil vapor probes will be driven adjacent to the structure foundation to a depth approximately 6 inches below the base of the foundation or to the top of the water table, whichever occurs first. Samples will be collected with a vacuum pump and Tedlar® bags, field screened with a photoionization detector (PID) and

multigas meter, then a second sample collected in the same manner and field-screened with the portable GC/MS in analyze mode to identify and quantify any cVOCs present in soil pore space adjacent to structures. At locations where groundwater is not encountered at the base of the foundation, the probe rod will be driven another 5 feet after the initial sample is collected, if soil conditions allow, to obtain another sample for vertical delineation data for soil gas. If groundwater is encountered, the approximate depth to water will be measured and recorded. It is anticipated that up to 50 locations will be field screened for near-slab soil gas concentrations during the study.

- *Near-slab Soil Gas Characterization Verification step: Collect soil gas samples in a Summa canister and submit selected soil gas samples for full volatile organics (TO-15) analysis at a UDOH certified laboratory at any location where a near-slab characterization sample exceeds the 11.0 µg/m^3 (1.62 ppbv) SL for PCE or where soil gas vapors are found to be elevated 10 times the RSL for the detected VOC. In addition, selected locations where the field portable GC/MS did not detect VOCs in soil gas will be sampled to confirm results. Sampling for laboratory analyses will be accomplished using Summa canisters equipped with flow regulators to collect 24-hour time-averaged samples from the soil vapor probes. Based on the expected number of buildings located within the area where soil gas impact caused by the PCE plume is most likely to occur, laboratory testing of soil gas is estimated to occur at up to 15 locations.*

- *Conduct additional near-slab, soil floor and crawl space for TO-15 analysis, using a UDOH certified and EPA-approved laboratory, at structure locations identified during the indoor air field characterization and during the field investigation as having high potential for vapor intrusion into indoor air. These locations are proposed to provide additional high-quality lab data for human health risk assessment resulting from the vapor intrusion pathway.*

Near-slab testing was chosen in lieu of sub-slab testing due to the presence of extremely shallow groundwater that occurs at or very near the slabs of many residences as indicated by numerous sump pumps and discharging footer drains. The likelihood of causing groundwater to leak into the basement of a structure by penetrating the slab to install testing apparatus was deemed too risky by the project team.

The indoor air assessment/characterization and near-slab soil gas sampling will commence at the same residences or occupied structures where owners have already indicated they will allow indoor air testing, and then pending permission to access additional properties, proceed to structure locations adjacent to the previously identified springs and seeps. It is anticipated that additional property owners may need to be actively recruited by VA in some portions of AOU-1 to fill data gaps, but at least 36 owners have already indicated a willingness to allow testing. The initial locations for indoor air and soil gas sampling are shown on Figure 9.

Section 6.2.3 Open-field Soil Gas Investigation is hereby replaced with QAPP Update Revision 1 Section 2.3.3 as follows:

Open-field soil gas data will be collected to provide a means of estimating the plume impacted area and to aid in evaluation of vapor intrusion potential. Concurrent with or immediately following the initial indoor air quality characterization steps and near-slab soil gas characterization, the investigative sampling approach for open field soil gas will proceed as follows:

- *Conduct field screening of soil gas levels and vertically profile the soil gas concentrations of PCE and daughter products in the vadose zone by manually or mechanically installing unsaturated (vadose) zone soil vapor sampling points near historically cVOC-impacted seeps and*

springs and in selected locations adjacent to streets/sidewalks (open field samples) in AOU-1. The field screening will be conducted by collecting soil gas samples in Tedlar bags for subsequent analysis using the field portable GC/MS equipment or the GC/MS probe will be connected directly to the sampling point. It is anticipated that soil gas samples will be collected from locations adjacent to the six spring identified during the previous investigations that contained PCE; then at the six spring locations that did not contain PCE; and then expand the sampling program to additional spring locations within AOU-1 as they are identified during field activities, up to an expected total of 50 samples.

- *Conduct additional open field soil gas sampling for TO-15 analysis, using a UDOH certified and EPA-approved laboratory.*

The open field soil gas sampling (near seeps or springs and along public right of ways) will commence at residences or occupied structures where owners have already indicated they will allow access for indoor air testing, and then pending permission to access, proceed to structure locations adjacent to the previously identified springs or seeps, and at selected locations on public rights of way.

Section 6.2.4 Surface Water and Shallow Groundwater Investigation is hereby replaced with QAPP Update Revision 1 Section 2.3.4 as follows:

Concurrent with or immediately following the initial indoor air quality characterization steps, the general investigative sampling approach for surface water and very shallow groundwater will also take place in phases and will proceed as follows:

- *Conduct initial field sampling and preliminary field screening analysis of surface water throughout AOU-1. This will be accomplished by collecting surface water samples at all locatable seeps, springs, and small surface water bodies suspected of being in contact with groundwater; and collecting sump pump discharge and foundation drain discharge samples at residences. In addition, water samples will be collected from selected Salt Lake City stormwater sewer manholes, located in and downgradient of AOU-1, to determine if groundwater seepage and discharge from foundation drains in AOU-1 is impacting the sewer. Surface samples collected during the investigation will be sent to the EPA CLP lab for analysis of VOCs. It is expected that up to 50 surface water samples will be analyzed for VOCs at the EPA CLP laboratory in accordance with CLP method protocol. Samples from a random subset (20%) of these locations will be analyzed for SVOCs, TAL metals, anions, TDS and pH at the CLP laboratory as appropriate or by the subcontractor laboratory ALS in Salt Lake City. 10% confirmation splits of the surface water samples will be collected and shipped to a different CLP laboratory for the same analysis (VOCs, SVOCs, and TAL metals) for quality assurance. The CLP laboratories will be selected by the EPA Region 8 Sample Coordinator prior to initiation of field activities.*

- *Up to 10 surface water samples will be collected and submitted to the University of Utah Stable Isotope Ratio Facility for Environmental Research for deuterium and oxygen-18 analysis.*

    - *Conduct initial field sampling and preliminary field screening analysis of very shallow groundwater (less than 12 feet below surface). This will be accomplished by manually installing up to 25 shallow temporary groundwater sample points into the water table near ponds, seeps, or springs adjacent to residences or occupied structures. An*

additional 35 temporary shallow groundwater sampling points will be installed to depths up to 30 feet using a truck or tractor-mounted GeoProbe™ Tool (or equivalent). If the GeoProbe™ unit hits refusal before the target depth is reached then permanent monitoring points will be installed as part of the RI for OU-2 at those locations. The mechanically installed sample points will be located along public rights of way throughout and surrounding the portion of the PCE plume in AOU-1 to further determine the extent of groundwater conditions in the areas likely to have the potential for vapor intrusion into occupied buildings. Very shallow groundwater sampling will focus on areas where elevated soil gas and indoor air PCE concentrations are detected at occupied structures, whereas the shallow GeoProbe™ points will focus on identification of the extent of the PCE relative to AOU-1. Up to 10 of the shallow sample points and GeoProbe™ points will be constructed as piezometers and covered with protective surface completions for additional water level measurements and possible additional sampling and analytical testing in the future. The remaining temporary sample points will be abandoned, as soon as sampling and water level measurements are completed. Groundwater samples collected during the investigation will be sent to the EPA CLP laboratory for VOC analysis.

- *Expedited turn-around time will be requested for analysis of preliminary COPCs in groundwater from the CLP laboratory during GeoProbe™ investigation in order to select additional groundwater sampling locations to support either 1) stepping out further from the East Side Springs area if preliminary COPCs are detected or 2) stepping in if no preliminary COPCs are detected. If expedited turn-around is not possible from the CLP laboratory, then samples will be sent to ALS in Salt Lake City for CLP VOC analysis. ALS will provide fast turn data and EPA level 2 type data deliverables to include analytical results and QC sample results. Expedited analysis data used to make real time field decisions will not be validated since the data is being used to screen for preliminary COPC detections and to further delineate sampling locations.*
- *Soil lithology will be performed on all locations in the focus area and 50 percent of locations outside the focus area. Locations to be selected to provide lithologic data throughout the investigation area.*
- *Approximately 50 groundwater samples will be collected and shipped to the CLP lab for VOC analysis in accordance with CLP protocols. Samples from a random subset (10%) of the groundwater sample locations will also be analyzed for SVOCs, total and dissolved metals, and alkalinity, anions, pH, TDS at the CLP laboratory as appropriate or by the subcontractor laboratory ALS in Salt Lake City. The CLP lab will be selected by the EPA Region 8 Sample Coordinator prior to initiation of field activities. It is expected that up to five groundwater samples will be submitted for laboratory analyses of SVOCs and total and dissolved metals.*
- *Temporary monitoring points converted to short term piezometers will be used to measure water levels at least two additional times throughout the year to determine seasonal changes in shallow groundwater elevations. In addition, up to five of the piezometers may be sampled for VOCs, SVOCs, and total and dissolved metals for analysis at a CLP laboratory.*

The field investigation for surface water and very shallow groundwater will commence in the vicinity of the 11 spring and seep locations (pending owner approval for access) previously sampled in 2010 and 2011 (UDEQ/DERR, 2011a, b, c), then proceed to spring and seep locations identified, but not tested during previous investigations (pending access approval), and for groundwater continue at properties whose owners have already requested indoor air pathway evaluation. Although not an explicit objective of the AOU-1 investigation, it is anticipated that surface and groundwater sampling will generally define the southwestern downgradient and western and southern cross-gradient extents of the PCE plume in surface water and in the very shallow groundwater within AOU-1. The resultant groundwater and surface water data will be used to guide additional groundwater characterization and placement of permanent monitoring wells during the subsequent site wide PCE plume RI. Figure 10 provides the approximate initial locations for surface water and shallow groundwater samples.

Table 11 Estimated Numbers of Samples by Media is hereby replaced by the following table:

TABLE 11: Estimated Numbers of Samples by Media
700 South 1600 East PCE Plume, Salt Lake City, Utah

Media	Data Level	Analyses	Estimated Number of Samples	Minimum Number of QC Samples	Rationale	Sample Designation[(b)]
Surface Water	CLP Protocol	Target List VOCs Field Water Quality Parameters[(a)]	50	3 field duplicates; 1 trip blank per cooler; 1 rinse blank/field blank per day if necessary	Field screening of identified seeps, springs, other surface water to support vapor intrusion pathway analysis	A-0001-mmddyy-SW-001

Ambient Background Air	Level 4 (CLP-equivalent)	Target List VOCs - TO-15/TO-15 SIM	6	1 field duplicate Shipped with other samples[(c)]	Confirm field results, determine indoor health effects, evaluate vapor intrusion pathway	A-0001-mmddyy-TO-001-OUT

Notes:

(a) DO, ORP, pH, conductivity, temperature, turbidity.
(b) See QAPP Update Revision 1 (Section 3.3.1) for sample naming convention.
(c) Confirmation sample totals include four locations selected in accordance with QAPP Amendment No. 1 and Minor Modification No. 2.

CLP – Contract Laboratory Program
DCE – cis-1,2-Dichloroethene
GC/MS – Gas chromatograph/mass spectrometer
NA – Not applicable
PCE – Tetrachloroethene
PCOPC – Preliminary contaminant of potential concern
SIM – Selective ion monitoring
SIRFER – Stable Isotopes Ratio Facility for Environmental Research, University of Utah
SVOC – Semivolatile organic compound
TCE – Trichloroethene
TDS – Total dissolved solids
VC – Vinyl chloride
VOC – Volatile organic compound

4. Minor Field Modifcation #5

The Health and Safety Plan (HASP) (Appendix C of the RIWP) has been replaced to reflect the protocols of the new contractor, EA Engineering, Science, and Technology, Inc., PBC (EA). The updated HASP is included with this minor field modification as Attachment 1.

5. Minor Field Modifcation #6

The following information is hereby included in section 6.2.4 of the RIWP for consistency with the QAPP Update Revision 1 with respect to the analysis of surface water samples for deuterium and oxygen-18 analysis (see Minor Field Modification #4):

- Up to 10 surface water samples will be collected for analysis of deuterium and oxygen-18.
- Analysis will be performed at the University of Utah Stable Isotope Ratio Facility for Environmental Research, Salt Lake City, Utah and will follow the SPATIAL/SIRFER CRDS Liquid Water Protocol (Attachment 2).
- The Project Manager for isotope analysis is Suvankhar Chakraborty of the University of Utah Stable Isotope Ratio Facility for Environmental Research.
- The data package deliverable for the stable oxygen and hydrogen isotope analysis will be an EPA Level 2 type package and will include the following information:
  - Cover letter or report title page with laboratory identification, client name and signature of person authorizing report release.
  - Summary of samples received that correlates field sample identification (ID) with the laboratory ID.
  - Chain of custody record.
  - Field ID number.
  - Date received.
  - Date prepared.
  - Date analyzed
  - Preparation and analytical methods.
  - Reference sample results
  - Case narrative that addresses the following information at a minimum:
  - Sample receipt discrepancies
  - Descriptions of all non-conformances in the sample receipt, handling, preparation, analytical and reporting processes, and the corrective action taken in each occurrence.
- The turnaround time for the isotope analysis is anticipated to be 45 days. An expedited turnaround time will likely not be required for the isotope analysis.
- Groundwater is analyzed using an autosampler and Picarro Cavity Ring-Down Spectroscopy (CRDS) system to determine $\delta^{18}O$ and $\delta^{2}H$ ratios.

Quality Control Samples (Lab) for Stable Oxygen and Hydrogen Isotope Parameters in Water
AOU-1 - 700 South 1600 East PCE Plume, Salt Lake City, Utah

QC Sample	Frequency	Method/SOP QC Acceptance Limits - δ^2H	Corrective Action	Person Responsible for Corrective Action	Data Quality Indicator (DQI)	Measurement Performance Criteria
Field Duplicate	1 per sampling event	Standard deviation of calibrated isotopic values for 3 or more replicate injections of the unknown sample must be less than 0.2‰ ($\delta^{18}O$) and 0.75‰ (δ^2H)	Evaluate batch precision for other QC samples and flag data accordingly	Data Reviewer	Precision	RPD less than 50% for detect data
PT[1] Reference Water	Run at beginning of run and after every 8 samples	Not vary by more than 0.9‰ for δ2H and 0.12‰ for δ18O (1 standard deviation)	If monthly values exceed the thresholds, the data from individual runs should be reviewed to identify and remedy potential errors in data processing or any systematic changes in instrument performance and their cause.	Laboratory Supervisor	Precision	Not vary by more than 0.9‰ for δ2H and 0.12‰ for δ18O (1 standard deviation)
PZ[1] Reference Water	1 per sample tray run	Standard deviation should be no more than 20% of the average parameter value across the month	Review data from individual runs to identify and remedy potential error or systematic changes. Reanalyze sample and reassess if necessary	Laboratory Supervisor	Precision	Less than or equal to 20% average over the month
UT[1] Reference Water	1 per sample tray run	Standard deviation should be no more than 20% of the average parameter value across the month	Review data from individual runs to identify and remedy potential error or systematic changes. Reanalyze sample and reassess if necessary	Laboratory Supervisor	Precision	Less than or equal to 20% average over the month

SUBJECT: Minor Field Modifications to the Sampling and Analysis Plan AOU-1: East Side Springs 700 South 1600 East PCE Plume Salt Lake City, Utah (July 2015)

1. Introduction

This document provides a description of minor modifications to the Sampling and Analysis Plan (SAP) AOU-1: East Side Springs 700 South 1600 East PCE Plume Salt Lake City, Utah (October 2014) to provide consistency for sampling methods, analytes, and other details documented in the SAP and the Quality Assurance Project Plan (QAPP). The SAP is included as Appendix A of the Remedial Investigation Work Plan (RIWP) AOU-1: East Side Springs 700 South 1600 East PCE Plume Salt Lake City, Utah (July 2015). Minor Field Modification #1 Protocol for Performing Indoor Air and Near-slab Soil Gas Assessments and Minor Field Modification #2 Clarification of QAPP Amendment Number 1 are included in the Final RIWP as Appendices K and L. Minor Field Modifications #3 - #6 are included in a separate document and detail changes to the RIWP. The following modifications are detailed below:

- Minor Field Modification #7 – Change of analytical method for analysis of 1,4-dioxane (EPA Crosswalk[1] items A6(a)(iv), A6(a)(vii), B1(b), B1(c), B2(a)(i), B2(b), B2(f)(ii), B2(h), B2(i), B3(a)(i), B3(b)(i), B3(d)(i), B4(b)(i), B4(c)(i), B5(a)(i), B6(b), B7(a)(i), B7(b)(i), B8(a)(ii))
- Minor Field Modification #8 – Updates to the analytical methods, parameters, and the sample media on which the analyses will be performed; updates to number of samples, sample locations and depth, analyses, collection methodology, etc. for each of the targeted media; change in use of HAPSITE gas chromatograph/mass spectrometer for field screening of groundwater and surface water samples (EPA Crosswalk[1] items A6(a)(ii), A6(a)(ix), A6(a)(x), A6(a)(xi), A6(a)(xii), B1(f)(i), B1(f)(vi))
- Minor Field Modification #9 – Inclusion of isotope analysis of surface water (EPA Crosswalk[1] items A3, A4(a)(iii), A4(e), A6(a)(x), B4(a)(ii), B4(f))
- Minor Field Modification #10 – Excludes installation of pressure transducers in temporary monitoring points for the 2016 field event (EPA Crosswalk[1] items A6(a)(xiv), B2(a)(ii))
- Minor Field Modification #11 – Clarifies use of the term definitive data (EPA Crosswalk[1] item B1(f)(i), B1(f)(iii), B1(f)(iv), B1(f)(v), B1(f)(vi), B1(f)(viii), B1(f)(ix))
- Minor Field Modification #12 – Updates to sample containers, preservatives, hold times and sample methods (EPA Crosswalk[1] items B2(f)(i), B2(g), B3(a)(ii))

- Minor Field Modification #13 – Removes field screening for SVOCs.

2. Minor Field Modifcation #7

The TO-15 SIM analyte list will include 1, 4-dioxane. Therefore, TO-13 sampling and analysis will not be used for any samples collected during the 2016 sampling event. This field modification is a change to sections 4.1 and 4.2 of the SAP.

3. Minor Field Modifcation #8

The following sections and table from the SAP have been updated for consistency with the QAPP Update Revision 1 with respect to 1) analytical methods, parameters, and the sample media on which the analyses will be performed; 2) number of samples, sample locations and depth, analyses, collection methodology, etc. for each of the targeted media; and 3) change in use of HAPSITE gas chromatograph/mass spectrometer for field screening of groundwater and surface water samples.

Section 4.1 Indoor Air Quality Screening, Characterization, and Verification is hereby replaced with QAPP Update Revision 1 Section 2.3.1 as follows:

The indoor air characterization approach is as follows:

- *Indoor Air Screening step: Access each occupied structure within AOU-1where the occupant/owner has granted access and complete visual inspection for potential indoor VOC sources and conduct resident interview. The indoor air will be analyzed for chlorinated volatile organic compounds (cVOCs) using the field portable GC/MS in quantitation mode. Screening will be conducted on each level (basements and living/working floors. If cVOCs are detected, the portable GC/MS will be run in survey mode to aid identification of background sources of cVOCs such as chemical products and dry-cleaned clothing. If such sources are found, the resident will be asked to relocate the materials from the occupied structure to prepare for real-time air assessment. It is estimated that as many as 300 occupied structures, including residences, schools, daycare facilities, and other businesses, are within the AOU-1 boundaries; however, participation of owners will likely be much less and reduce the actual testing locations, with 30 to 50 structures estimated to be included in the testing.*
- *Indoor Air Characterization step: Conduct real-time assessment of indoor air quality at accessible occupied structures within the AOU-1 area where permission has been obtained. The characterization of indoor air will occur in the breathing zone under both ambient conditions approximately 30 minutes after the indoor source screening step is completed and then after the structure is placed under negative differential pressurization (target differential pressure of 10 pascals, equivalent of 0.04 inches of water, a level that replicates the effects of typical cold season stack effects, between inside and outside) as measured with a portable field manometer. Each structure for which access has been granted within AOU-1will be evaluated for cVOCs, using the portable GC/MS in analyze mode, with testing occurring within the breathing zone on basements and living/working levels of the structure to identify the compounds present in the indoor air. A properly calibrated portable GC/MS in analyze mode is capable of achieving low ppbv to parts per trillion by volume detection limits for PCE and TCE in air. The portable GC/MS will also be used in analyze mode to measure ambient outdoor background concentrations concurrent with the indoor activities. To the extent practical given site access*

considerations and variable wind directions over the period of sampling, one outdoor air sample will be collected associated with each structure.

- *Indoor Air Verification step: Conduct indoor air sampling using Summa canisters equipped with flow regulators to collect 24-hour time-averaged samples in structures where concentrations of the 5 PCOPCs exceed the screening levels shown in RIWP Appendix H. Concurrent measurements for differential air pressure (inside and outside) will be taken during this step to assure samples are representative of conditions that create vapor intrusion. Samples will be sent to a Utah Department of Health (UDOH)-certified laboratory for volatile organic compound (VOC) analysis or VOC-Selective Ion Monitoring (SIM) analysis to achieve lower reporting limits for PCOCs using the EPA Toxic Organics (TO)-15 analytical method. Laboratory testing of indoor air is estimated to occur at approximately 25 structures out of the 30 to 500 expected to be initially assessed in the AOU-1 area, and analysis of up to 40 indoor samples is expected (some structures will require multiple sample locations). Based on Minor Field Modification #1, an additional 4 structures will be sampled to aid the assessment of whether vinyl chloride is present at concentrations below the detection limit using the portable GC/MS. This is needed because the vinyl chloride reporting limit using the portable GC/MS is above the screening level, whereas, the reporting limit for laboratory samples is below the detection limit. The selected structures will be located where groundwater is within 10 to 20 feet of the ground surface and will include:*

  - *One sample outside the Plume where PCE, TCE, and cis-DCE in the indoor air are below the screening levels (SLs) or the detection limit of the HAPSITE® instrument.*
  - *Three samples will be collected inside the area of the Plume where PCE and TCE are equal to or less than their respective SLs but above the instrument detection limits.*

  At least three outdoor (upwind, downwind, and in the center of AOU-1) ambient background samples will be collected during the confirmation sampling activities for laboratory analysis for VOCs using method TO-15.

- *Additional Monitoring Activities: In addition to the initial screening, which will be conducted under cold season and low water table conditions, a second round of assessment and confirmation sampling of indoor air at up to 15 selected outdoor background and indoor air locations, based on the potential for indoor air exposure, will be conducted during Spring 2016. This phase will be conducted in the vicinity of known PCE contamination based on results from the initial sampling. The area of AOU-1 where PCE was previously detected above the screening level in indoor air samples and shallow groundwater is anticipated is known as the focus area. The re-testing will be conducted using both real-time field analyses (portable GC/MS) and confirmatory laboratory analysis using Summa canisters for sample collection and offsite laboratory analysis.*

Section 4.2 Near-slab Soil Gas Investigation is hereby replaced with QAPP Update Revision 1 Section

2.3.2 as follows:

The near-slab soil gas characterization approach will be implemented concurrent with the indoor air characterization to identify and characterize cVOCs present in soils adjacent to tested structures, as follows:

> *Near-slab Soil Gas Characterization step: Conduct soil gas characterization adjacent to structures screened and assessed for vapor intrusion where the property owner agreed to soil gas sampling and sampling is practical given site conditions. Soil vapor probes will be driven adjacent to the structure foundation to a depth approximately 6 inches below the base of the foundation or to the top of the water table, whichever occurs first. Samples will be collected with a vacuum pump and Tedlar® bags, field screened with a photoionization detector (PID) and multigas meter, then a second sample collected in the same manner and field-screened with the portable GC/MS in analyze mode to identify and quantify any cVOCs present in soil pore space adjacent to structures. At locations where groundwater is not encountered at the base of the foundation, the probe rod will be driven another 5 feet after the initial sample is collected, if soil conditions allow, to obtain another sample for vertical delineation data for soil gas. If groundwater is encountered, the approximate depth to water will be measured and recorded. It is anticipated that up to 50 locations will be field screened for near-slab soil gas concentrations during the study.*

- *Near-slab Soil Gas Characterization Verification step: Collect soil gas samples in a Summa canister and submit selected soil gas samples for full volatile organics (TO-15) analysis at a UDOH certified laboratory at any location where a near-slab characterization sample exceeds the 11.0 µg/m^3 (1.62 ppbv) SL for PCE or where soil gas vapors are found to be elevated 10 times the RSL for the detected VOC. In addition, selected locations where the field portable GC/MS did not detect VOCs in soil gas will be sampled to confirm results. Sampling for laboratory analyses will be accomplished using Summa canisters equipped with flow regulators to collect 24-hour time-averaged samples from the soil vapor probes. Based on the expected number of buildings located within the area where soil gas impact caused by the PCE plume is most likely to occur, laboratory testing of soil gas is estimated to occur at up to 15 locations.*

- *Conduct additional near-slab, soil floor and crawl space for TO-15 analysis, using a UDOH certified and EPA-approved laboratory, at structure locations identified during the indoor air field characterization and during the field investigation as having high potential for vapor intrusion into indoor air. These locations are proposed to provide additional high-quality lab data for human health risk assessment resulting from the vapor intrusion pathway.*

Near-slab testing was chosen in lieu of sub-slab testing due to the presence of extremely shallow groundwater that occurs at or very near the slabs of many residences as indicated by numerous sump pumps and discharging footer drains. The likelihood of causing groundwater to leak into the basement of a structure by penetrating the slab to install testing apparatus was deemed too risky by the project team.

The indoor air assessment/characterization and near-slab soil gas sampling will commence at the same residences or occupied structures where owners have already indicated they will allow indoor air testing, and then pending permission to access additional properties, proceed to structure locations adjacent to the previously identified springs and seeps. It is anticipated that additional property owners may need to be actively recruited by VA in some portions of AOU-1 to fill data gaps, but at least 36 owners have already indicated a willingness to allow testing. The initial locations for indoor air and soil gas sampling are shown on Figure 4.

Section 4.3 Open-field Soil Gas Investigation is hereby replaced with QAPP Update Revision 1 Section

2.3.3 as follows:

Open-field soil gas data will be collected to provide a means of estimating the plume impacted area and to aid in evaluation of vapor intrusion potential. Concurrent with or immediately following the initial indoor air quality characterization steps and near-slab soil gas characterization, the investigative sampling approach for open field soil gas will proceed as follows:

- *Conduct field screening of soil gas levels and vertically profile the soil gas concentrations of PCE and daughter products in the vadose zone by manually or mechanically installing unsaturated (vadose) zone soil vapor sampling points near historically cVOC-impacted seeps and springs and in selected locations adjacent to streets/sidewalks (open field samples) in AOU-1. The field screening will be conducted by collecting soil gas samples in Tedlar bags for subsequent analysis using the field portable GC/MS equipment or the GC/MS probe will be connected directly to the sampling point. It is anticipated that soil gas samples will be collected from locations adjacent to the six spring identified during the previous investigations that contained PCE; then at the six spring locations that did not contain PCE; and then expand the sampling program to additional spring locations within AOU-1 as they are identified during field activities, up to an expected total of 50 samples.*
- *Conduct additional open field soil gas sampling for TO-15 analysis, using a UDOH certified and EPA-approved laboratory.*

The open field soil gas sampling (near seeps or springs and along public right of ways) will commence at residences or occupied structures where owners have already indicated they will allow access for indoor air testing, and then pending permission to access, proceed to structure locations adjacent to the previously identified springs or seeps, and at selected locations on public rights of way.

Section 4.4 Surface Water and Shallow Groundwater Investigation is hereby replaced with QAPP Update Revision 1 Section 2.3.4 as follows:

Concurrent with or immediately following the initial indoor air quality characterization steps, the general investigative sampling approach for surface water and very shallow groundwater will also take place in phases and will proceed as follows:

- *Conduct initial field sampling and preliminary field screening analysis of surface water throughout AOU-1. This will be accomplished by collecting surface water samples at all locatable seeps, springs, and small surface water bodies suspected of being in contact with groundwater; and collecting sump pump discharge and foundation drain discharge samples at residences. In addition, water samples will be collected from selected Salt Lake City stormwater sewer manholes, located in and downgradient of AOU-1, to determine if groundwater seepage and discharge from foundation drains in AOU-1 is impacting the sewer. Surface samples collected during the investigation will be sent to the EPA CLP lab for analysis of VOCs. It is expected that up to 50 surface water samples will be analyzed for VOCs at the EPA CLP laboratory in accordance with CLP method protocol. Samples from a random subset (20%) of these locations will be analyzed for SVOCs, TAL metals, anions, TDS and pH at the CLP laboratory as appropriate or by the subcontractor laboratory ALS in Salt Lake City. 10% confirmation splits of the surface water samples will be collected and shipped to a different CLP laboratory for the same analysis (VOCs, SVOCs, and TAL metals) for quality assurance. The*

CLP laboratories will be selected by the EPA Region 8 Sample Coordinator prior to initiation of field activities.

- *Up to 10 surface water samples will be collected and submitted to the University of Utah Stable Isotope Ratio Facility for Environmental Research for deuterium and oxygen-18 analysis.*
    - *Conduct initial field sampling and preliminary field screening analysis of very shallow groundwater (less than 12 feet below surface). This will be accomplished by manually installing up to 25 shallow temporary groundwater sample points into the water table near ponds, seeps, or springs adjacent to residences or occupied structures. An additional 35 temporary shallow groundwater sampling points will be installed to depths up to 30 feet using a truck or tractor-mounted GeoProbe™ Tool (or equivalent). If the GeoProbe™ unit hits refusal before the target depth is reached then permanent monitoring points will be installed as part of the RI for OU-2 at those locations. The mechanically installed sample points will be located along public rights of way throughout and surrounding the portion of the PCE plume in AOU-1 to further determine the extent of groundwater conditions in the areas likely to have the potential for vapor intrusion into occupied buildings. Very shallow groundwater sampling will focus on areas where elevated soil gas and indoor air PCE concentrations are detected at occupied structures, whereas the shallow GeoProbe™ points will focus on identification of the extent of the PCE relative to AOU-1. Up to 10 of the shallow sample points and GeoProbe™ points will be constructed as piezometers and covered with protective surface completions for additional water level measurements and possible additional sampling and analytical testing in the future. The remaining temporary sample points will be abandoned, as soon as sampling and water level measurements are completed. Groundwater samples collected during the investigation will be sent to the EPA CLP laboratory for VOC analysis.*
- *Expedited turn-around time will be requested for analysis of preliminary COPCs in groundwater from the CLP laboratory during GeoProbe™ investigation in order to select additional groundwater sampling locations to support either 1) stepping out further from the East Side Springs area if preliminary COPCs are detected or 2) stepping in if no preliminary COPCs are detected. If expedited turn-around is not possible from the CLP laboratory, then samples will be sent to ALS in Salt Lake City for CLP VOC analysis. ALS will provide fast turn data and EPA level 2 type data deliverables to include analytical results and QC sample results. Expedited analysis data used to make real time field decisions will not be validated since the data is being used to screen for preliminary COPC detections and to further delineate sampling locations.*
- *Soil lithology will be performed on all locations in the focus area and 50 percent of locations outside the focus area. Locations to be selected to provide lithologic data throughout the investigation area.*
- *Approximately 50 groundwater samples will be collected and shipped to the CLP lab for VOC analysis in accordance with CLP protocols. Samples from a random subset (10%) of the groundwater sample locations will also be analyzed for SVOCs, total and dissolved metals, and alkalinity, anions, pH, TDS at the CLP laboratory as appropriate or by the subcontractor laboratory ALS in Salt Lake City. The CLP lab will be selected by the EPA Region 8 Sample*

Coordinator prior to initiation of field activities. It is expected that up to five groundwater samples will be submitted for laboratory analyses of SVOCs and total and dissolved metals.

- *Temporary monitoring points converted to short term piezometers will be used to measure water levels at least two additional times throughout the year to determine seasonal changes in shallow groundwater elevations. In addition, up to five of the piezometers may be sampled for VOCs, SVOCs, and total and dissolved metals for analysis at a CLP laboratory.*

The field investigation for surface water and very shallow groundwater will commence in the vicinity of the 11 spring and seep locations (pending owner approval for access) previously sampled in 2010 and 2011 (UDEQ/DERR, 2011a, b, c), then proceed to spring and seep locations identified, but not tested during previous investigations (pending access approval), and for groundwater continue at properties whose owners have already requested indoor air pathway evaluation. Although not an explicit objective of the AOU-1 investigation, it is anticipated that surface and groundwater sampling will generally define the southwestern downgradient and western and southern cross-gradient extents of the PCE plume in surface water and in the very shallow groundwater within AOU-1. The resultant groundwater and surface water data will be used to guide additional groundwater characterization and placement of permanent monitoring wells during the subsequent site wide PCE plume RI. Figure 10 provides the approximate initial locations for surface water and shallow groundwater samples.

Table 1 Estimated Numbers of Samples by Media is hereby replaced by the following table:

TABLE 1: Estimated Numbers of Samples by Media
700 South 1600 East PCE Plume, Salt Lake City, Utah

Media	Data Level	Analyses	Estimated Number of Samples	Minimum Number of QC Samples	Rationale	Sample Designation[(b)]
Surface Water	CLP Protocol	Target List VOCs Field Water Quality Parameters[(a)]	50	3 field duplicates; 1 trip blank per cooler; 1 rinse blank/field blank per day if necessary	Field screening of identified seeps, springs, other surface water to support vapor intrusion pathway analysis	A-0001-mmddyy-SW-001
Surface Water	CLP Protocol, EPA Lab or Subcontractor Lab	Target List VOCs, SVOCs (including 1,4-dioxane), Metals, Anions, pH Field Water Quality Parameters[(a)]	10	1 field duplicate; 1 rinse blank/field blank per day if necessary; 1 trip blank per cooler	Predictive pathway analysis and support future groundwater investigation	A-0001-mmddyy-SW-001
Surface Water	CLP Protocol	Target List VOCs, SVOCs (including 1,4-dioxane), and Metals	5	1 trip blank per cooler	Quality assurance split samples	A-0001-mmddyy-SW-001A
Surface Water and Groundwater	SIRFER Standard Operating Procedure	Hydrogen and Oxygen Stable Isotopes	10	NA	Support future groundwater investigation	A-0001-mmddyy-SW-001
Groundwater (first saturated interval)	EPA Method Protocol	PCOPCs Target List (PCE, TCE, DCE, VC) Field Water Quality Parameters[(a)]	50	1 trip blank per week	Initial groundwater plume delineation samples at proposed locations to support real-time field decisions	A-0001-mmddyy-GW-001
Groundwater (Temporary Sampling Points)	CLP Protocol, EPA Lab or Subcontractor Lab	Target List VOCs, SVOCs (including 1,4-Dioxane), Metals, Anions, Alkalinity, TDS, pH Field Water Quality Parameters[(a)]	10	1 field duplicate; 1 trip blank per cooler; 1 rinse blank/field blank per day if necessary	Predictive pathway analysis and support future groundwater investigation	A-0001-mmddyy-GW-001

TABLE 1: Estimated Numbers of Samples by Media
700 South 1600 East PCE Plume, Salt Lake City, Utah

Media	Data Level	Analyses	Estimated Number of Samples	Minimum Number of QC Samples	Rationale	Sample Designation[b]
Soil Gas (open areas)	Field Analysis	Direct Read or Tedlar® Bag VOCs - GC/MS	50	5 field duplicates 3 field blanks	Real time soil gas results for field decisions	A-0001-mmddyy-SG-001-ft
Soil Gas (open areas)	Level 4 (CLP Equivalent)	Target List TO-15/TO-15 SIM	15	2 field duplicates	Confirm field results; predictive vapor intrusion pathway analysis	A-0001-mmddyy-SG-001-ft
Soil Gas (near slab)	Field Analysis	Direct Read or Tedlar® Bag VOCs - GC/MS	50	5 field duplicates 3 field blanks	Real time field results to support indoor air pathway evaluation	A-0001-mmddyy-SG-001-ft-
Soil Gas (near slab)	CLP Equivalent (Level 4)/ Definitive	Target List TO-15/TO-15 SIM	15[d]	2 field duplicates	Confirm field results, predictive vapor intrusion pathway analysis	A-0001-mmddyy-SG-001-ft
Indoor Air	Field Analysis	Direct Read Probe VOCs - GC/MS	1100 - 1400	NA	Real Time analyses for indoor air sources, real time determination of indoor air health effects.	A-0001-mmddyy-IA-001-ABC
Indoor Air	Level 4 (CLP Equivalent)	Target List VOCs TO-15/ TO-15 SIM	55[d]	6 field duplicates[c]	Confirm field results, determine indoor health effects, evaluate vapor intrusion pathway	A-0001-mmddyy-TO-001-ABC

TABLE 1: Estimated Numbers of Samples by Media
700 South 1600 East PCE Plume, Salt Lake City, Utah

Media	Data Level	Analyses	Estimated Number of Samples	Minimum Number of QC Samples	Rationale	Sample Designation[(b)]
Soil	CLP Protocol	Target List VOCs, SVOCs, Metals	3	1 field duplicate 1 equip blank Shipped with other samples[(c)]	Data needed to support risk assessment	A-0001-mmddyy-SS-001-ft
Ambient Background Air	Field Analysis	Direct Read Probe VOCs - GC/MS	60	NA	Two samples – one upwind and one downwind of structure tested for indoor air	A-0001-mmddyy-OA-001-OUT
Ambient Background Air	Level 4 (CLP-equivalent)	Target List VOCs - TO-15/TO-15 SIM	6	1 field duplicate Shipped with other samples[(c)]	Confirm field results, determine indoor health effects, evaluate vapor intrusion pathway	A-0001-mmddyy-TO-001-OUT

Notes:

(a) DO, ORP, pH, conductivity, temperature, turbidity.
(b) See QAPP Update Revision 1 (Section 3.3.1) for sample naming convention.
(c) Confirmation sample totals include four locations selected in accordance with QAPP Amendment No. 1 and Minor Modification No. 2.

CLP – Contract Laboratory Program
DCE – cis-1,2-Dichloroethene
GC/MS – Gas chromatograph/mass spectrometer
NA – Not applicable
PCE – Tetrachloroethene
PCOPC – Preliminary contaminant of potential concern
SIM – Selective ion monitoring
SIRFER – Stable Isotopes Ratio Facility for Environmental Research, University of Utah
SVOC – Semivolatile organic compound
TCE – Trichloroethene
TDS – Total dissolved solids
VC – Vinyl chloride
VOC – Volatile organic compound

4. Minor Field Modifcation #9

The following information is hereby included in the SAP for consistency with the QAPP Update Revision 1 with respect to the analysis of surface water samples for deuterium and oxygen-18 analysis (see Minor Field Modification #8):

- Up to 10 surface water samples will be collected for analysis of deuterium and oxygen-18.
- Analysis will be performed at the University of Utah Stable Isotope Ratio Facility for Environmental Research, Salt Lake City, Utah and will follow the SPATIAL/SIRFER CRDS Liquid Water Protocol (Attachment 1).
- The Project Manager for isotope analysis is Suvankhar Chakraborty of the University of Utah Stable Isotope Ratio Facility for Environmental Research. Mr. Chakraborty is hereby included in the SAP distribution list.
- The data package deliverable for the stable oxygen and hydrogen isotope analysis will be an EPA Level 2 type package and will include the following information:
  - Cover letter or report title page with laboratory identification, client name and signature of person authorizing report release.
  - Summary of samples received that correlates field sample identification (ID) with the laboratory ID.
  - Chain of custody record.
  - Field ID number.
  - Date received.
  - Date prepared.
  - Date analyzed
  - Preparation and analytical methods.
  - Reference sample results
  - Case narrative that addresses the following information at a minimum:
  - Sample receipt discrepancies
  - Descriptions of all non-conformances in the sample receipt, handling, preparation, analytical and reporting processes, and the corrective action taken in each occurrence.
- The turnaround time for the isotope analysis is anticipated to be 45 days. An expedited turnaround time will likely not be required for the isotope analysis.
- Groundwater is analyzed using an autosampler and Picarro Cavity Ring-Down Spectroscopy (CRDS) system to determine $\delta^{18}O$ and $\delta^{2}H$ ratios.

5. Minor Field Modifcation #10

Pressure transducers will not be installed in temporary monitoring wells per the QAPP Update Revision 1. This will affect Section 5.1.5 and 5.9 of the SAP.

6. Minor Field Modifcation #11

Updates to the SAP for the clarification of the term definitive data are documented in the errata sheet (General Erratum #3) which states that the terms “screening” and “definitive” are hereby removed throughout the document to be consistent with the use of these terms in the QAPP Update Revision 1.

7. Minor Field Modification #12

Table 4 Sample Collection Summary: Aqueous/Liquid (CLP Methods) and Table 5 Sample Collection Summary: Vapor/Gases are hereby replaced by QAPP Update Revision 1 Table 16 (Attachment 2).

8. Minor Field Modifcation #13

Analysis of field samples will be performed for VOCs but not for SVOCs for the 2016 field event. The PCOPC 1,4-dioxane will be analyzed using the VOC TO-15 SIM method. This change has been addressed by Minor Field Modification #7.

CRDS Water Isotope Analyzer Operation

Created 2014 by Crystal Tulley-Cordova

Revised 3/10/2015 by Kali Blevins

Part 1 – Sample Preparation

1. Fill standard and sample vials
    a. Pipette samples
        i. Pipette 0.5 mL from sample container into 2mL crimp-top vial. Use a separate, clean pipette tip for each sample. Discard used tips into a beaker for washing and re-use.
        ii. Use crimper to seal lid. Check to make sure the lid is tight (i.e. does not rotate on the top of the vial) and cleanly crimped. If the crimper is not creating a tight seal, you can adjust it with an Allen wrench.
        iii. Pipette samples 8 at a time, writing each sample name or a unique abbreviation of each sample name on each 2 mL vial with a sharpie.
        iv. Place samples in the sample tray leaving the first four plate locations empty and leaving one plate location blank between each group of eight samples. Empty locations will be used for reference waters. A maximum of 56 samples should be run at a time.
    b. Pipette reference water
        i. In order to limit evaporation, minimize the amount of time the reference waters are out of the refrigerator and the amount of time the cap is off of the reference water bottles. After pipetting reference waters, immediately replace the cap securely on the bottle and parafilm tightly around the cap.
        ii. Pipette 0.5 mL from container into 2mL crimp-top vial. Use a separate, clean pipette tip for each reference water. Discard used tips into a beaker for washing and re-use.
        iii. Use crimper to seal lid. Check to make sure the lid is tight (i.e. does not rotate on the top of the vial) and cleanly crimped.
        iv. Fill 1 vial with reference water PZ and 1 with reference water UT. These primary references are used to calibrate each run.
        v. Fill 1 vial with PT to put at the beginning of the run, 1 additional vial to run before every 8 samples, and 1 to be run in the last plate location. This secondary reference water is used to quality check the accuracy of the calibration regression and to generate a drift correction in each run. An example plate map is shown below.

Table 1. Example plate map with maximum plate locations filled

64	Sample54	65	Sample55	66	Sample56	67	PT	68		69		70	
57	Sample48	58	PT	59	Sample49	60	Sample50	61	Sample51	62	Sample52	63	Sample53
50	Sample41	51	Sample42	52	Sample43	53	Sample44	54	Sample45	55	Sample46	56	Sample47

1	PT	2	PZ	3	UT	4	PT	5	Sample1	6	Sample2	7	Sample3

Part 2 – Instrument Preparation

2. Clean syringe
    a. Unplug Autosampler and carefully remove syringe
    b. Don gloves (latex or nitrile), a lab coat, and safety goggles
    c. Open chemical fume hood sash, turn on light, and ensure that it is functioning properly with adequate air flow
    d. Lay down 2 Kimwipes; one to lay syringe on and another for ejecting solvent onto
    e. Use solvent (1-methyl-2-pyrrolidinone) from cabinet below hood to clean the syringe
        i. Insert syringe through the septum on solvent bottle, preferably targeting a previously punctured location. Be careful not to bend the syringe tip.
        ii. Extract solvent with syringe to capacity by moving plunger slowly until it comes out of the syringe. Rotate the plunger as you remove it to thoroughly clean the syringe. Rotating may also help to free the plunger if it becomes stuck.
        iii. Remove syringe from solvent bottle and eject solvent from syringe onto Kimwipe by replacing the plunger in the syringe and fully depressing it.
        iv. Repeat process at least three times or as many times as necessary until the plunger moves smoothly and easily in the syringe. If you cannot get the plunger to move freely it might need to be replaced. Note that broken syringes must be discarded in the sharps container.
        v. Once complete, re-cap the solvent bottle and return to storage under hood. Leave the Kimwipe with the ejected solvent in the fume hood until the solvent has completely evaporated before discarding.
    f. Use deionized water to rinse the syringe three times, fully filling and emptying the syringe each time
    g. Dry syringe
        i. Remove the plunger from the syringe, wiping it with a Kimwipe
        ii. Insert tip of syringe into the piece of blue tubing near the compressed air station, preferably locating a pre-existing hole and being careful not to bend the syringe
        iii. Place the opening of the tubing loosely against the air nozzle (do not try to force tubing over the nozzle)
        iv. Turn the air on and let it run until any water has been blown out of the syringe

v. Check the syringe to ensure that no water droplets remain and then replace the plunger. This eliminates the possibility of air bubbles that might affect the fill volume of the syringe.

h. Replace Syringe
   i. Plug the power supply to the autosampler back in
   ii. On the CRDS computer desktop, open the Autosampler Controller and press Chg Syringe button and wait for the syringe holder to move into position
   iii. Place syringe in syringe holder, making sure body and plunger are in holding locations
   iv. Press Swap Done button on Autosampler Controller

3. Fill out instrument log
   a. Open the sample log file on the desktop of the CRDS instrument computer
   b. Input the following information: date, time, initials, project name, number of samples, number of injections, N_2 pressure from the primary regulator on the N_2 tank
      i. N_2 pressure on the primary regulator should be > 150 psi. If the value is lower do not start the run. Wait for all instruments to finish their runs and then replace the tank will a full one. If no full spare tanks remain on the rack alert the SPATIAL facility manager who will order replacements.
      ii. N_2 pressure on the red, secondary regulator (on the bench top near the tanks) should be 2 (+/- 0.3) psi. If outside this range alert the SPATIAL facility manger. This value does not need to be recorded in the log.
   c. Look at the previous row to determine whether the septum should be changed – the septum should be changed every 300 injections. See section 5 for instructions on changing the septum. Indicate with an "X" if you have changed the septum or syringe.
4. Fill out sample ID file
   a. Open "Sample_list_template.csv" from desktop
   b. In the runfiles folder, save as "YYMMDD_project_HIDS20XX"
   c. Fill out template with sample IDs and project identifiers
5. Change septum
   a. The septum needs to be changed every 300 injections. Check run log to see if it needs to be replaced.
   b. Unscrew the injection port of the vaporizer, using fingers or tool that sits on top of the injection port to grasp and turn the ceramic top of the port. Caution: ceramic surface is warm, but metal parts at base of injection port will be hot.
   c. Remove old septum, replace with new septum. Check to see that new septum is centered.
   d. Replace injection port and hand-tighten
6. Check glass wool
   a. Make sure the glass wool container remains dry and no condensation is apparent in the vial. Check to make sure that the aquarium pump is working correctly and air is being forced through the opening at the top of the vial.

7. Check that background H_2O concentration reported in the data viewer window is below 100 ppm. If not, check that the N_2 tank regulator valve is open and the primary and secondary regulator pressures are correct (see #3).
8. Open Coordinator Launcher
    a. Don't press launch yet
    b. Make sure High Precision program ("AI High Precision" on some instruments) is selected
9. Open Autosampler Control
    a. Check that the following settings are correct:
        i. Row 1 is set for samples 1-4 and ten injections
        ii. Row 2 is set for samples 5-67 and four injections
        iii. If running less than 67 vials, update number in row 2 to match the position of the final sample in the autosampler tray
        iv. Method should be set as 'GJB rinse' (see Appendix)
    b. Click the Run button
10. After clicking Run in Autosampler Control, click the Launch button in Coordinator Launcher
11. Watch first few samples before leaving lab to ensure no problems at start of analysis
12. **Do not open OpenOffice files while run in progress, otherwise raw data will be lost and not saved to .csv file**

Part 3 – Data Processing

13. Run ChemCorrect
    a. After analysis has completed, close the Coordinator Launcher and Autosampler Control and open ChemCorrect from the desktop of the Picarro computer
    b. Click the Source button and navigate to the file with the correct date
    c. Click the 'OK' button to run ChemCorrect
    d. Examine the results to ensure that no samples show evidence for contamination, as indicated by red highlighting in the results window. Any samples flagged for contamination should be treated with activated charcoal and re-run.
        i. Uncap sample vial, add 0.5 mg activated charcoal, recap, and invert 3 times.
        ii. Allow treated sample to rest for 12 or more hours before re-analyzing.
        iii. If the same sample is flagged for contamination by ChemCorrect a second time, the sample should be transferred to the SIRFER lab for analysis by IRMS.
14. Process data
    a. Ensure that the data has been synced to the Dropbox folder and can be accessed from a computer with R installed on it.
    b. Open R and open the R script 'CRDS_liquid_3.R'
    c. Following the instructions in the R script, process the data and write an excel workbook with the data and quality assurance information. Also see the information in CRDS Data Processing R Scripts protocol.
    d. Examine the quality control and final sample data by running the appropriate functions in R and/or examining the information written to the excel workbook.

i. Quality control metrics for the run are compared against the criteria stored in the file "CRDS_liquid_parameters.csv". If any of the quality metrics have been violated, as indicated by the 'Ignore_Run' flag, troubleshooting will be necessary to determine why and all of the samples should be rerun. Examine the memory correction terms, the raw and memory-corrected values for the primary reference waters, the raw, memory-corrected, and drift-corrected values for the secondary reference water to determine what may have caused the quality parameter to be violated and correct for this before running samples again.

ii. Raw data for any individual samples that have violated the quality parameters, as indicated by an 'Ignore' flag, but was not flagged by ChemCorrect, should be reviewed manually.

1. Open the .csv instrument output file for the run and identify the analysis results for the four injections of the problem sample.
2. If one of the four injections is a clear outlier (> 3 standard deviations different from the other 3 in terms of H_2O concentration or either isotope ratio) the results for this injection can be deleted from the file. Highlight column "F" and all columns to the right for the row representing the outlier injection and delete the contents. Save the results file as a copy, appending "toAnalyze" at the end of the file name. No more than injection can be deleted for any given sample. Re-process the data file using the R scripts before exporting the results to the database and excel file.
3. If there is no clear outlier or if more than one injection appears to be an outlier the sample should be re-analyzed. If the sample has already been re-run twice, it should be transferred to SIRFER to be analyzed by IRMS.

e. After examining the data, run the appropriate functions in R to upload the data to the database and export an Excel results file.

Part 4 – Sample Disposal

15. Keep 2 mL sample vials in fridge for two weeks after returning data in case some need to be re-run. After this window, discard used sample vials in Broken Glass box.

containers in which they were received from the laboratory. The chain-or-custody record will be placed in one of the boxes.

Commercial carriers are not required to sign the chain-of-custody record if it is sealed inside the shipping cooler and the custody seals remain intact. The laboratories are responsible for storing the samples in a secure location and following chain-of-custody procedures.

Soil and water samples will be collected in certified clean containers provided by the project laboratory. Air samples for TO-15 and TO-15 SIM analysis will be collected in individually clean certified Summa canisters with certified clean flow controllers. The requirements for sample volumes, sampling containers, preservation, and holding times are summarized in Table 16 below.

Samplers are responsible for shipping samples to the appropriate non-CLP and CLP-assigned laboratory for analysis. Samplers may contact their RSCC to obtain their laboratory assignment notification.

3.3.3 *Chain-of-Custody*

A chain-of-custody record (Attachment 5) establishes the documentation necessary to trace sample possession from time of collection through sample analysis and final disposition and serves to document the specific analyses requested from the laboratory. A sample is in the custody of a person if any of the following criteria are met:

- the sample is in a person's physical possession;
- the sample is in a person's view after being in his or her physical possession;
- the sample was in a person's physical possession and was then locked up or sealed to prevent tampering; and/or
- the sample is kept in a secured area.

The chain-of-custody in Attachment 5 is included as an example form. For samples being submitted to the CLP laboratory, a custody tracking software called Scribe will be used. An electronic chain-of-custody record created using the Scribe software contains basic header

PROTOCOL: **LIMITED** **FULL**

PRE-FIELD/LAB SUPPLIES

YES or NO or NA: Individually certified-clean SUMMA canister(s) and flow controller(s) on-hand (if needed)?

HAPSITE CALIBRATION

YES or NO: HAPSITE was calibrated by KD Analytical-trained personnel prior to initiation of sampling event?

YES or NO: Five-point HAPSITE calibration met quality assurance criteria for all target analytes (cis-DCE, TCE, PCE) and was recorded on the HAPSITE field form (relative standard deviation (RSD) < 20%, RSD of response factor < 30%, and curve fit R-squared ≥ 0.98)?

YES or NO: If HAPSITE not calibrated on date of form completion, was a calibration verification sample analyzed using a known concentration calibration gas and was the relative percent difference (RPD) for all target analytes ≥ 70% or ≤ 130 %.

YES or NO: Was continuing calibration verification standard run at end of the daily sampling event?

FIELD DOCUMENTATION

YES or NO: All required field documentation on-site (field log book, HAPSITE Field Form, Pressure Cycling Field Form, SUMMA Field Form, Analytical Laboratory Chain of Custody [COC], Minor Field Modification #18)?

LIMITED VI PROTOCOL SAMPLING CHECKLIST

1. **YES or NO:** Signed access agreement has been obtained?

2. **YES or NO:** Reviewed completed residential questionnaire?

3. **YES or NO:** HAPSITE was operated by KD Analytical-trained personnel?

4. **YES or NO:** All levels of structure have had at least one indoor air sample analyzed with the HAPSITE?

5. **YES or NO:** If interior background source(s) was identified, was its location and product name recorded in the field log book?

6. **YES or NO or NA:** If interior background source(s) was identified, was the structure owner informed of the product and was its removal requested and granted?

7. **YES or NO or NA:** If interior background source(s) was identified, was a future appointment to deploy a 24-hr SUMMA canister scheduled no sooner than 72 hours after HAPSITE identification and removal of the interior background source?

8. **YES or NO:** Were any vapor intrusion entry points identified within the structure? If so, was the location(s) recorded in the field log book along with a description?

9. **YES or NO or NA:** If no interior background source(s) was identified, was a 24-hr SUMMA canister deployed in the lowest livable space within the structure?

10. **YES or NO or NA:** Was the deployment location, date/time, initial pressure, canister/flow controller identification number, sample Identification number recorded on the SUMMA field form?

11. **YES or NO or NA:** Do completed SUMMA tags match information recorded on the SUMMA field form and COC?

12. **YES or NO or NA:** Was a canister retrieval appointment scheduled (< 23 hours from canister deployment time)?

13. **YES or NO:** Was a SUMMA field duplicate required? If so, was it deployed?

14. **YES or NO:** Was the correct sample identification assigned to the SUMMA sample(s)?

15. **YES or NO:** Was all applicable field documentation completed?

16. **YES or NO:** Were adequate field notes taken during the sampling event?

17. **YES or NO:** Were corrections to field notes necessary? If so, were corrections completed correctly (i.e., single-line through the error, initialed, and dated)?

18. **YES or NO:** Were the HAPSITE and SUMMA Field Forms completed properly?

19. **YES or NO:** Was the laboratory COC completed properly?

FULL VI PROTOCOL SAMPLING CHECKLIST

1. **YES or NO:** Signed access agreement has been obtained?

2. **YES or NO:** Reviewed completed residential questionnaire?

3. **YES or NO:** Were all underground utilities marked by Blue Stake and/or 3rd Party Utility locate?

4. **YES or NO:** HAPSITE was operated by KD Analytical-trained personnel?

5. **YES or NO:** All levels of structure have had at least one indoor air sampled analyzed with the HAPSITE?

6. **YES or NO:** If interior background source(s) was identified, was its location and product name recorded in the field log book?

7. **YES or NO or NA:** If interior background source(s) was identified, was the structure owner informed of the product and was its removal requested and granted?

8. **YES or NO:** Was the structure's air volume calculated?

9. **YES or NO:** Were all combustible appliances turned off prior to beginning pressure cycling?

10. **YES or NO:** Were all target differential pressures achieved during pressure cycling (both negative and positive)?

11. **YES or NO:** Were 2.5 air volume exchanges achieved during pressure cycling (both negative and positive)?

12. **YES or NO:** Were any vapor intrusion entry points identified within the structure? If so, was the location(s) recorded in the field log book along with a description?

13. **YES or NO:** Was the required soil gas sample collected at approximately 6-inches below the basement slab grade?

14. **YES or NO:** Were any indoor air RALs exceeded? If so, were the Project Manager and VA informed of the exceedance?

15. **YES or NO:** Were any indoor air RSLs exceeded? If so, were the Project Manager and VA informed of the exceedance?

16. **YES or NO:** If an indoor air RSL was exceeded, was a future appointment scheduled to deploy a 24-hr SUMMA canister and collect a soil gas sample for TO-15 analysis?

17. **YES or NO or NA:** Was the deployment location, date/time, initial pressure, canister/flow controller identification number, sample Identification number recorded on the SUMMA field form?

18. **YES or NO or NA:** Do completed SUMMA tags match information recorded on the SUMMA field form and COC?

19. **YES or NO or NA:** Was a canister retrieval appointment scheduled (< 23 hours from canister deployment time)?

20. **YES or NO:** Was a SUMMA field duplicate required? If so, was it deployed?

21. **YES or NO:** Was the correct sample identification assigned to the SUMMA sample(s)?

22. **YES or NO:** Was all applicable field documentation completed?

23. **YES or NO:** Were adequate field notes taken during the sampling event?

24. YES or NO: Were corrections to field notes necessary? If so, were corrections completed correctly (i.e., single-line through the error, initialed, and dated)?

25. **YES or NO:** Were the HAPSITE and SUMMA Field Forms completed properly?

26. **YES or NO:** Was the laboratory COC completed properly?

I ,_____, certify that this quality assurance checklist was reviewed and completed and that all field forms herein referenced were completed and reviewed at the end of the sampling event conducted on _____.

STATEMENT OF TECHNICAL REVIEW

AOU-1 Remedial Investigation for 700 South 1600 East PCE Plume, Salt Lake City, UT
Final Quality Control Summary Report, 2017 Indoor Air Sampling

The CH2M HILL, Inc. team has completed the technical review of the submittal of the Final Quality Control Summary Report. Notice is hereby given that an independent technical review has been conducted that is appropriate to the level of risk and complexity inherent in the project, as defined in the Contractor Quality Control Plan. During the independent technical review, compliance with established policy principles and procedures, using justified and valid assumptions, was verified. This included review of assumptions; methods, procedures, and material used in analyses; the appropriateness of data used and level of data obtained; and reasonableness of the results, including whether the product meets the customer's needs consistent with the law and existing U.S. Army Corps of Engineers policy.

SECTION 1

Introduction

Indoor air samples were collected and analyzed during the spring 2017 Veterans Affairs Comprehensive Environmental Response, Compensation, and Liability Act Investigation in support of the Department of Veterans Affairs remedial investigation of Accelerated Operable Unit 1 (AOU-1), part of the 700 South 1600 East tetrachloroethene (PCE) Plume in Salt Lake City, Utah. Samples were collected in accordance with the sampling and analysis plan (SAP) (FE, 2014), the Quality Assurance Project Plan (QAPP) (EA, 2016), and subsequent minor field modifications to the QAPP. Analytical data were evaluated by CH2M HILL, Inc. (CH2M) as described in the QAPP. This quality control summary report (QCSR) summarizes the chemical data quality review for the samples collected by CH2M.

This QCSR covers 11 indoor air samples and 3 indoor air field duplicate (FD) samples. These samples were reported under three sample delivery groups (SDGs) by the laboratory. Samples were collected between March 10 and April 14, 2017, and were analyzed for volatile organic compounds (VOCs) using the methods shown in Table 1-1. The analyses were performed by ALS Environmental Laboratory in Salt Lake City, Utah.

The analytical data packages are included in Appendix A, along with the corresponding data package completeness checklist that verifies all quality control (QC) elements were provided in the analytical data package by the laboratory. The data validation reports associated with each SDG are provided in Appendix B.

SECTION 2

Sampling Activities

Sampling was conducted in accordance with the SAP. Table 2-1 presents a list of sample locations planned for collection as identified in the SAP. Samples were collected and delivered by CH2M to the laboratory. No deviations from the SAP occurred during the sampling event. Table 2-2 provides the following information sorted by field sample:

- Field sample identification (ID)
- Dates of sample collection and sample receipt by the laboratory
- Laboratory SDG number/sample ID
- Analytical method

Field QC samples collected during the sampling event are presented in Table 2-3.

SECTION 3

Data Quality Evaluation Procedures

Ninety percent of all samples were evaluated on an SDG-by-SDG basis by CH2M chemists for data quality using Tier 2B validation review, and 10 percent of the samples for each analysis were evaluated using Tier 4 validation review as described in the QAPP. The data evaluation for Tier 2B included reviewing: (1) chain-of-custody documentation, (2) holding-time compliance, (3) required QC samples at the specified frequencies, (4) flagging for analytical blanks, (5) laboratory control sample/laboratory control sample duplicates (LCS/LCSD), (6) surrogate spike recoveries, (7) initial and continuing calibration information, and (8) other method-specific criteria as defined by the QAPP. In addition to the data evaluation listed for Tier 2B above, the Tier 4 data evaluation included sample result and instrument response re-calculation and review of instrument outputs (e.g., chromatograms and mass spectra) to verify correct peak identification for a selected, subset of the data.

Field samples were also reviewed to ascertain field compliance and data quality issues, including reviewing FDs.

Data validation flags were assigned in accordance with *CLP National Functional Guidelines for Review of Organic Data* (EPA, 2013). These flags, as well as the reason for each flag, are uploaded into the project electronic database and are included in the data validation reports (Appendix B). Multiple flags may be routinely applied to specific sample method/matrix/analyte combinations, but there will be only one final flag. A final flag is applied to the data and is the most conservative of the applied validation flags. The final flag also includes blank sample impacts. The data flags are defined below.

- J = Analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample (estimated).
- R = Data are unusable. The sample results are rejected due to serious deficiencies in the ability to analyze the sample and to meet quality control criteria. The presence or absence of the analyte cannot be verified.
- U = Analyte was analyzed for but not detected above the reported method detection limit, or this analyte was considered not detected due to laboratory or field blank contamination.
- UJ = Analyte was analyzed for but not detected above the reported method detection limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

The overall summaries of the data quality evaluation procedures are outlined in the following subsections. Specific analyte results and samples that were qualified are discussed in the data validation reports (Appendix B) and are summarized in Table 3-1.

3.1 Sample Receipt and Chain-of-Custody Documentation

All samples met the custodial possession and transfer requirements. No discrepancies were noted during sample receipt. Chain-of-custody documentation is provided in the analytical data packages (Appendix A).

3.2 Holding Times

Analytical holding times were evaluated against the criteria listed in Table 16 of the QAPP (EA, 2016). For methods requiring both sample preparation and analysis, the preparation/extraction holding time will be calculated from the time of sampling to the initiation of preparation/extraction. The analysis holding

time will be calculated from the time of completion of preparation/extraction to the time of completion of the analysis, including any required dilutions, confirmation analysis, and reanalysis. For methods requiring analysis only, the holding time is calculated from the time of sampling to completion of the analysis, including any required dilutions, confirmation analysis, and reanalysis. All holding times were met.

3.3 Tuning and Calibration

Instrument tuning and calibration was evaluated in accordance with the calibration criteria specified in the method. Tuning and calibration criteria were generally met, with the following exceptions:

- The initial calibration exceeded the relative standard deviation criteria of not greater than 40 percent for 1,2,4-trichlorobenzene and benzyl chloride for U.S. Environmental Protection Agency (EPA) Method TO-15. The exceedances were in the range of 43 to 48 percent difference. Six non-detected results were qualified as estimated and flagged UJ.
- During one analytical run, the continuing calibration verification standard exceeded the upper control limit (UCL) of 30 percent from the expected value for carbon tetrachloride for EPA Method TO-15. The exceedance was +38 percent difference. Four detected results were qualified as estimated concentrations and flagged J.
- Two sample results were reported for acetone that exceeded the upper calibration range for EPA Method TO-15. The samples were not re-analyzed on a diluted basis. The detected results were qualified as estimated concentrations and flagged J.

3.4 Method Blanks

Method blanks are used to monitor each analytical batch for interference and/or contamination from hardware, reagents, and other potential contaminant sources within the laboratory. A method blank is an analyte-free matrix (humidified ultra-high purity nitrogen) to which all reagents are added in the same amount or proportions as are added to samples. It is processed through the entire analytical procedure along with the samples in the batch. At least 1 method blank is prepared for each analytical batch of 20 samples or fewer. Method blanks were analyzed at the required frequency and were free of contamination that would affect the sample results.

3.5 Field Duplicates

An FD or collocated sample, is an independent sample collected as close as possible to the original sample from the same source under identical conditions. FDs for indoor air samples are to be collected and analyzed on a 10 percent basis for EPA Methods TO-15 and TO-15 selective ion monitoring (SIM) analyses or a minimum of 1 per sampling event if fewer than 10 air samples are submitted at a time, and are used to document sampling and analytical precision and representativeness. Precision is expressed in terms of the relative percent difference (RPD) between the native and FD sample results. The RPD criterion for FDs is less than 40 percent. Qualification is performed on the native sample and associated FD results. FDs were collected and analyzed at the required frequency and precision criteria were met.

3.6 Surrogates

Surrogates are organic analytes that behave similar to analytes of interest, or have been chemically altered (that is, chemically deuterated), but are not expected to occur naturally in samples. They are spiked into the standards, field samples, and laboratory QC samples before sample analysis. The results of surrogate spikes provide additional information about the possible influence of the matrix on the

accuracy of the measurements for organic analyses only. Accuracy criteria are listed in Table 22 of the QAPP (EA, 2016), and all criteria were met.

3.7 Laboratory Control Samples

LCSs are used to monitor method performance for a given analyte in each matrix. An LCS is an analyte-free matrix (humidified ultra-high purity nitrogen) spiked with known amounts of analytes that come from a source different than that used for calibration standards. Target analytes specified in the QAPP will be spiked into the LCS. The LCS is processed through the entire analytical procedure along with the samples in the batch. At least 1 LCS is prepared for each analytical batch of 20 samples or less. Accuracy and precision criteria are listed in Table 22 of the QAPP (EA, 2016). LCSs and LCSDs were analyzed at the required frequency and criteria were generally met, with the following exception:

- The percent recovery of carbon tetrachloride exceeded the UCL in one LCS/LCSD for EPA Method TO-15. Two detected results were qualified as estimated concentrations and flagged J.

3.8 Internal Standards

Internal standards are compounds that are spiked into the standards, field samples, and laboratory QC samples before sample analysis. They are used to quantify the target analytes. Internal standards provide for stable sensitivity and response during every analytical run. An internal standard is used to evaluate the efficiency of the sample introduction process and monitor the efficiency of the analytical procedure for each sample matrix encountered. Internal standard acceptance criteria are listed in Table 22 of the QAPP (EA, 2016) and criteria were generally met, with the following exception:

- The internal standard area responses for all internal standards for Sample A0064H-041417-TO-001-LIV exceeded the UCL for EPA Method TO-15 SIM. The sample was re-analyzed with similar results. One detected result was qualified as an estimated concentration and flagged J and four non-detected results were qualified as estimated and flagged UJ.

3.9 Low Level Detects

Sample results between the method detection limit and the reporting limit have been flagged “J”. These qualified results represent values determined at levels where the true value of the measured chemical could not be quantified with a high degree of confidence. The laboratory met the QAPP-specified reporting limits. All data flagged for low-level imprecision were the result of the sample concentrations and not laboratory related.

3.10 Overall Assessment

The final activity in the data quality evaluation is an assessment of whether the data meet the data quality objectives. The goal of this assessment is to demonstrate that a sufficient number of representative samples were collected, and the resulting analytical data can be used to support the decision-making process. The following subsections present the field completeness, analytical data completeness, and project completeness for this sampling event.

3.10.1 Field Completeness

Field completeness for sample collection was assessed by comparing the number of samples properly collected to the number of samples planned for collection. As shown in Table 2-1, 11 samples were planned for VOC sample collection, and all samples were collected. The appropriate QC samples were also collected. Therefore, the field completeness for VOCs was 100 percent.

3.10.2 Analytical Data Completeness

Acceptable analytical data are a measure of laboratory contract compliance. Acceptable data include all data that have completed the review or validation process and have not been rejected. The acceptable data completeness percentage for VOCs is 100 percent for all SDGs.

3.10.3 Project Completeness

Project completeness combines both sampling and analytical protocols to assess the expectations of the project as a whole. Project completeness is calculated using the field and analytical completeness percentages. Overall project completeness for this event is 100 percent.

SECTION 4

Conclusions

The overall project completeness was 100 percent. The data are acceptable for use as qualified.

[a]Sample results flagged "J" to note detection between the method detection limit and the reporting limit have not been included in this table.

Notes:
µg/m^3 = microgram(s) per cubic meter
EPA = U.S. Environmental Protection Agency
J = Estimated value. The analyte was present, but the reported value may not be precise.
SIM = selective ion monitoring
U = Not detected. The analyte was analyzed for, but not detected above the method detection limit.

Validation Reasons:
>ICLinearRange = Result exceeded the linear calibration range of the method
CCV>UCL = The continuing calibration verification standard recovery was greater than the upper control limit
IC%RSD = The percent relative standard deviation of the initial calibration exceeded criteria
IS>UCL = The internal standard recovery was greater than the upper control limit
LCS>UCL = The laboratory control sample recovery was greater than the upper control limit
LCSD>UCL = The laboratory control sample duplicate recovery was greater than the upper control limit

Analytical Data Packages/Data Package Completeness Checklists

VA SLC AOU-1 (700 South 1600 East PCE Plume)

Data Package Completeness Review Checklist

SDG: 1707721

Date Received: 03/31/17

Required Documentation	Yes	No	Comments
1. Cover letter complete with the following information:	x		Cover is Case Narrative.
• Title of report and laboratory unique report identification (sample delivery group number)	x		Title of report and project name are absent. SDG ID present.
• Project name, site location		X	
• Name and location of laboratory and second-site or subcontracted laboratory	X		
• Client name and address	X		Client name was included. No address was present for the client on the cover letter.
• Statement of authenticity and official signature and title of person authorizing report release	X		Electronic signature at the end of "Analytical Results" section
2. Summary of samples received that correlates field sample IDs with the laboratory IDs	X		
3. Laboratory qualifier flags and definitions	X		
4. Preparation and/or analytical methods	X		
5. Sample results for each analyte (dry weight basis for soils)			
• Date received	X		
• Date analyzed (and time of analysis if the holding time is less than or equal to 48 hours)	X		
• Percent solids results for soil samples			N/A
• Dilution factor (provide both diluted and undiluted results when available)	X		
• Sample-specific reporting limit adjusted for sample size, dilution/concentration	X		
• Sample-specific MDL adjusted for sample size, dilution/concentration	X		MDL and RL only in ppb
• Units	X		
6. Case Narrative that addresses the following information at a minimum:		X	See comment for Item 1 above
• Sample receipt discrepancies	X		See Sample Acceptance Check Form for any noted discrepancies
• Descriptions of all non conformances in the sample receipt, handling, preparation, analytical and reporting processes and the corrective action taken in each occurrence	X		
• Identification and justification for sample dilution	X		No dilutions.
• Sample cooler temperature at time of receipt			N/A

Required Documentation	Yes	No	Comments
• Final residual vacuum of each sample canister immediately prior to analysis, or upon receipt (Air analyses only)	X		On "Sample Acceptance Check Form".
7. Surrogate percent recoveries (surrogate result, target concentration, percent recovery)	X		
8. MS/MSD and LCS spike concentrations, native sample results, spiked sample results, percent recoveries, and RPDs between the MS and MSD results (associated QC limits must also be provided)	X		*MS/MSDs not applicable to Air analyses.*
9. Method blank results	X		
10. Analytical batch reference number that cross references samples to QC sample analyses	X		Batch ID present.
11. Executed COC and sample receipt checklist	X		
12. Analytical sequence or laboratory run log that contains sufficient information to correlate samples reported in the summary results to the associated method QC information, such as initial and continuing calibration analyses	X		
13. Calibration blank results for inorganic analyses (required in hardcopy format only)			N/A
14. Inductively coupled plasma (ICP) interference check sample for inorganic analyses, true and measured concentrations and percent recoveries (required in hardcopy format only)			N/A
15. Reporting Limit Check Standard for inorganic analyses, true and measured concentrations and percent recoveries (if applicable, required in hardcopy format only)			N/A
16. Post-digestion spike recoveries for inorganic analyses, (if applicable; required in hardcopy format only)			N/A
17. Internal Standard recovery and retention time information, as applicable.	X		
18. Initial calibration summary, including standard concentrations, response factors, average response factors, RSDs or correlation coefficients, and calibration plots or equations, if applicable (required in hardcopy format only)	X		
19. Continuing calibration verification summary, including expected and recovered concentrations and percent differences (required in hardcopy format only)	X		
20. Instrument tuning and mass calibration information for ICP/mass spectrometry analyses	X		
21. All associated instrument printouts for all samples, standards, and QC samples (e.g., raw data) necessary to re-calculate results as well as all manual integrations (if performed)	X		
22. Sample preparation logs that include the following information			*Not applicable to Air analyses*
• Preparation start and end times			N/A
• Beginning and ending temperatures of water baths and digestion blocks			N/A

Data package complete and ready for Validation *Shannon Fitzsimmons* Date: 5/3/17

Case Narrative

Method:	**TO15**	**Client:**	CH2M Hill
Analysis:	**VOA**		
Preparation SOP #:	**IH-AN-014**	**Matrix:**	**Air**
Work Order:	**1707721**		

Analysis / Method: Method TO15 is an EPA method used in the analysis of air samples for volatile organics by GC/MS, which have been sampled in a silonized canister.

General Set Information: ALS received seven summa canisters for VOA analysis. The samples were analyzed within thirty days of sampling. Recoveries of target analytes are reported on the Sample Analysis Data Sheet in units of ppb v/v and μg/m³.

Sample Preparation: This method has no extraction procedure for air samples. The sample preparation date is the same as the date of analysis. Two hundred milliliters of air sample and 100 milliliters of Internal Standard were trapped using an Entech 7100 microscale purge and trap concentrator.

Instrument Calibration: The GC/MS was hardware tuned to meet the criteria for 4-Bromofluorobenzene as specified in the SOP. This tune check is valid for 24 hours.

Initial and Continuing Calibration Verification: The initial calibration curve, which was analyzed prior to sample analysis, met the specified criteria of the SOP. For the initial calibration curve, the %RSD of the response factors for the TO-15 analytes were checked.

A continuing calibration standard (CCS) was analyzed prior to sample analysis. The CCS met the criteria as specified in the SOP.

Method Blank Analysis: A laboratory method blank was prepared using 200 milliliters of humidified ultra high purity nitrogen and 100 milliliters of Internal Standards and analyzed prior to sample analysis. The blank was free of volatile organic contaminants.

Data Qualifier Codes: A "J" qualifier indicates that the result is greater than the MDL but less than the PQL. Analytes found in field samples, which also appear in the method blank above the PQL are reported with a "B" qualifier in the flag column. The "E" qualifier indicates a reported value above the analytical linear range.

LCS/LCSD: An LCS and LCSD pair was analyzed for the analytical batch.

Dilutions: None.

NC/CAR: None.

Miscellaneous Comments: Instrument designation is HP5972-L. Field samples were analyzed using auto sampler positions that were free from volatile contaminants. The "E" qualifier indicates a reported value above the analytical linear range.

Sample Calculations: Target Compounds

Relative Response Factor: $$\mathbf{RRF} = \left[\frac{\mathbf{A_x}}{\mathbf{A_{is}}}\right]\left[\frac{\mathbf{C_{is}}}{\mathbf{C_x}}\right]$$

Where $\mathbf{A_x}$ is the area of the characteristic ion for the compound to be measured, $\mathbf{A_{is}}$ is the area of the characteristic ion for the internal standard , $\mathbf{C_{is}}$ is the concentration of the internal standard, and $\mathbf{C_x}$ is the concentration of the compound to be measured.

Concentration in ppb v/v: $$C = \left[\frac{\mathbf{(A_x)\,(I_s)\,(Df)}}{\mathbf{(A_{is})\,(RRF)}}\right]$$

Concentration in ug/m^3 : $C =$ **ppb v/v (MW/24.45)**

Where $\mathbf{I_s}$ is the amount of internal standard spiked in ppb, **Df** is a dilution factor (1 if no dilutions are made), **RRF** is the relative response factor (assumed to be 1 for non target analytes) and **MW** is the molecular weight of the compound of interest.

General Lab Comments

The results provided in this report relate only to the items tested.
Samples were received in acceptable condition unless otherwise noted.
Samples have not been blank corrected unless otherwise noted.
This test report shall not be reproduced, except in full, without written approval of ALS.

ALS provides professional analytical services for all samples submitted. ALS is not in a position to interpret the data and assumes no responsibility for the quality of the samples submitted.

All quality control samples processed with the samples in this report yielded acceptable results unless otherwise noted.

ALS is accredited for specific fields of testing (scopes) in the following testing sectors. The quality system implemented at ALS conforms to accreditation requirements and is applied to all analytical testing performed by ALS. The following table lists testing sector, accreditation body, accreditation number and website. Please contact these accrediting bodies or your ALS project manager for the current scope of accreditation that applies to your analytical testing.

ANALYTICAL REPORT

Workorder: 34-1707721
Client: CH2M
Project Manager: Kevin W. Griffiths

Result Symbol Definitions

MDL = Method Detection Limit, a statistical estimate of method/media/instrument sensitivity.
RL = Reporting Limit, a verified value of method/media/instrument sensitivity.
CRDL = Contract Required Detection Limit
Reg. Limit = Regulatory Limit.
ND = Not Detected, testing result not detected above the MDL or RL.
< This testing result is less than the numerical value.
** No result could be reported, see sample comments for details.

Qualifier Symbol Definitions

U = Qualifier indicates that the analyte was not detected above the MDL.
J = Qualifier Indicates that the analyte value is between the MDL and the RL. It is also used to indicate an estimated value for tentatively identified compounds in mass spectrometry where a 1:1 response is assumed.
B = Qualifier indicates that the analyte was detected in the blank.
E = Qualifier indicates that the analyte result exceeds calibration range.
P = Qualifier indicates that the RPD between the two columns is greater than 40%.

Symbols and Definitions

- * - Analyte above reporting limit or outside of control limits
- ▲ - Sample result is greater than 4 times the spike added
- ◓ - Sample and Matrix Duplicate less than 5 times the reporting limit
- ● - Result is above the calibration range
- # - The Matrix Spike, Matrix Spike duplicate or Matrix Duplicate is reported for your information only. The sample matrix may be inappropriate for the method selected.

RPD - Relative % Difference (Spike / Spike Duplicate)
ND - Not Detected (U - Qualifier also flags analyte as not detected)
NA - Not Applicable
QC results are not adjusted for moisture correction, where applicable

Possible Hazard Identification
☒ Non-Hazard ☐ Skin Irritant ☐ Rad
☐ Flammable ☐ Poison ☐ Unknown

Sample Disposal
☐ Return to Client ☐ Archive _____ Months
☒ Disposal by Lab
(fees assessed for samples retained > 3 months)

Data Deliverable:
☐ Level 1 ☐ Level 3
☐ Level 2 ☑ Level 4
EDD Type: LABSPEC 7

Requested Turn Around Time
☐ 2 Days (Rush) ☐ 7 Days (Rush)
☐ 3 Days (Rush) ☒ 14 Days
(Rush = email data by COB on day due. Surcharges assessed.)

ALS Environmental
Sample Acceptance Check Form

Client: CH2MHill Work order:

Project: AOU1 700 S 1600E PCE Plume

Sample(s) received on: 3/17/2017 Date opened: 3/17/2017 by: Julie Warath/Kevin Gr

Note: This form is used for all samples received by ALS. The use of this form for custody seals is strictly meant to indicate presence/absence and not as an indication of compliance or nonconformity. Thermal preservation and pH will only be evaluated either at the request of the client and/or as required by the method/SOP.

		Yes	No	N/A
1	Were **sample containers** properly marked with client sample ID?	☒	☐	☐
2	Did **sample containers** arrive in good condition?	☒	☐	☐
3	Were **chain-of-custody** papers used and filled out?	☒	☐	☐
4	Did **sample container labels** and/or tags agree with custody papers?	☒	☐	☐
5	Was **sample volume** received adequate for analysis?	☒	☐	☐
6	Are samples within specified holding times?	☒	☐	☐
7	Was proper **temperature** (thermal preservation) of cooler at receipt adhered to?	☐	☐	☒
8	Were **custody seals** on outside of cooler/Box/Container?	☐	☒	☐
	Location of seal(s)? _____ Sealing Lid?	☐	☐	☒
	Were signature and date included?	☒	☐	
	Were seals intact?	☐	☐	☒
9	Do containers have appropriate **preservation**, according to method/SOP or Client specified information?	☐	☐	☒
	Is there a client indication that the submitted samples are **pH** preserved?	☐	☐	☒
	Were **VOA vials** checked for presence/absence of air bubbles?	☐	☐	☒
	Does the client/method/SOP require that the analyst check the sample pH and if necessary alter it?	☐	☐	☒
10	**Tubes:** Are the tubes capped and intact?	☐	☐	☒
11	**Badges:** Are the badges properly capped and intact?	☐	☐	☒
	Are dual bed badges separated and individually capped and intact?	☐	☐	☒

Client Sample ID	Container Description	Required pH *	Received pH	Adjusted pH	VOA Headspace (Presence/Absence)	Receipt / Preservation Comments

Data Package Completeness Review Checklist

SDG: 1709321

Date Received: 04/17/17

Required Documentation	Yes	No	Comments
1. Cover letter complete with the following information:	X		Cover is Case Narrative.
• Title of report and laboratory unique report identification (sample delivery group number)	X		Title of report and project name are absent. SDG ID present.
• Project name, site location		X	
• Name and location of laboratory and second-site or subcontracted laboratory	X		
• Client name and address	X		Client name was included. No address was present for the client on the cover letter.
• Statement of authenticity and official signature and title of person authorizing report release	X		Electronic signature at the end of "Analytical Results" section
2. Summary of samples received that correlates field sample IDs with the laboratory IDs	X		
3. Laboratory qualifier flags and definitions	X		
4. Preparation and/or analytical methods	X		
5. Sample results for each analyte (dry weight basis for soils)			
• Date received	X		
• Date analyzed (and time of analysis if the holding time is less than or equal to 48 hours)	X		
• Percent solids results for soil samples			N/A
• Dilution factor (provide both diluted and undiluted results when available)	X		
• Sample-specific reporting limit adjusted for sample size, dilution/concentration	X		
• Sample-specific MDL adjusted for sample size, dilution/concentration	X		MDL and RL only in ppb
• Units	X		
6. Case Narrative that addresses the following information at a minimum:		X	See comment for Item 1 above
• Sample receipt discrepancies	X		See Sample Acceptance Check Form for any noted discrepancies
• Descriptions of all non conformances in the sample receipt, handling, preparation, analytical and reporting processes and the corrective action taken in each occurrence	X		
• Identification and justification for sample dilution	X		No dilutions.
• Sample cooler temperature at time of receipt			N/A

Required Documentation	Yes	No	Comments
• Final residual vacuum of each sample canister immediately prior to analysis, or upon receipt (Air analyses only)	X		On "Sample Acceptance Check Form".
7. Surrogate percent recoveries (surrogate result, target concentration, percent recovery)	X		
8. MS/MSD and LCS spike concentrations, native sample results, spiked sample results, percent recoveries, and RPDs between the MS and MSD results (associated QC limits must also be provided)	X		*MS/MSDs not applicable to Air analyses.*
9. Method blank results	X		
10. Analytical batch reference number that cross references samples to QC sample analyses	X		Batch ID present.
11. Executed COC and sample receipt checklist	X		
12. Analytical sequence or laboratory run log that contains sufficient information to correlate samples reported in the summary results to the associated method QC information, such as initial and continuing calibration analyses	X		
13. Calibration blank results for inorganic analyses (required in hardcopy format only)			N/A
14. Inductively coupled plasma (ICP) interference check sample for inorganic analyses, true and measured concentrations and percent recoveries (required in hardcopy format only)			N/A
15. Reporting Limit Check Standard for inorganic analyses, true and measured concentrations and percent recoveries (if applicable, required in hardcopy format only)			N/A
16. Post-digestion spike recoveries for inorganic analyses, (if applicable; required in hardcopy format only)			N/A
17. Internal Standard recovery and retention time information, as applicable.	X		
18. Initial calibration summary, including standard concentrations, response factors, average response factors, RSDs or correlation coefficients, and calibration plots or equations, if applicable (required in hardcopy format only)	X		
19. Continuing calibration verification summary, including expected and recovered concentrations and percent differences (required in hardcopy format only)	X		
20. Instrument tuning and mass calibration information for ICP/mass spectrometry analyses	X		
21. All associated instrument printouts for all samples, standards, and QC samples (e.g., raw data) necessary to re-calculate results as well as all manual integrations (if performed)	X		
22. Sample preparation logs that include the following information			*Not applicable to Air analyses*
• Preparation start and end times			N/A
• Beginning and ending temperatures of water baths and digestion blocks			N/A

Data package complete and ready for Validation *Mark Fesler* Date: 5/5/17

Case Narrative

Method:	**TO15**	**Client:**	CH2M Hill
Analysis:	**VOA**		
Preparation SOP #:	**IH-AN-014**	**Matrix:**	**Air**
Work Order:	**1709321**		

Analysis / Method: Method TO15 is an EPA method used in the analysis of air samples for volatile organics by GC/MS, which have been sampled in a silonized canister.

General Set Information: ALS received four summa canisters for VOA analysis. The samples were analyzed within thirty days of sampling. Recoveries of target analytes are reported on the Sample Analysis Data Sheet in units of ppb v/v and $\mu g/m^3$.

Sample Preparation: This method has no extraction procedure for air samples. The sample preparation date is the same as the date of analysis. Two hundred milliliters of air sample and 100 milliliters of Internal Standard were trapped using an Entech 7100 microscale purge and trap concentrator.

Instrument Calibration: The GC/MS was hardware tuned to meet the criteria for 4-Bromofluorobenzene as specified in the SOP. This tune check is valid for 24 hours.

Initial and Continuing Calibration Verification: The initial calibration curve, which was analyzed prior to sample analysis, met the specified criteria of the SOP. For the initial calibration curve, the %RSD of the response factors for the TO-15 analytes were checked.

A continuing calibration standard (CCS) was analyzed prior to sample analysis. The CCS met the criteria as specified in the SOP.

Method Blank Analysis: A laboratory method blank was prepared using 200 milliliters of humidified ultra high purity nitrogen and 100 milliliters of Internal Standards and analyzed prior to sample analysis. The blank was free of volatile organic contaminants.

Data Qualifier Codes: A "J" qualifier indicates that the result is greater than the MDL but less than the PQL. Analytes found in field samples, which also appear in the method blank above the PQL are reported with a "B" qualifier in the flag column. The "E" qualifier indicates a reported value above the analytical linear range.

LCS/LCSD: An LCS and LCSD pair was analyzed for the analytical batch.

Dilutions: None.

NC/CAR: None.

Miscellaneous Comments: Instrument designation is HP5972-L. Field samples were analyzed using auto sampler positions that were free from volatile contaminants. The "E" qualifier indicates a reported value above the analytical linear range.

Sample Calculations: Target Compounds

Relative Response Factor: $$\mathbf{RRF} = \left[\frac{\mathbf{A_x}}{\mathbf{A_{is}}}\right]\left[\frac{\mathbf{C_{is}}}{\mathbf{C_x}}\right]$$

Where $\mathbf{A_x}$ is the area of the characteristic ion for the compound to be measured, $\mathbf{A_{is}}$ is the area of the characteristic ion for the internal standard , $\mathbf{C_{is}}$ is the concentration of the internal standard, and $\mathbf{C_x}$ is the concentration of the compound to be measured.

Concentration in ppb v/v: $$C = \left[\frac{\mathbf{(A_x)\,(I_s)\,(Df)}}{\mathbf{(A_{is})\,(RRF)}}\right]$$

Concentration in ug/m^3 : $C =$ **ppb v/v (MW/24.45)**

Where $\mathbf{I_s}$ is the amount of internal standard spiked in ppb, **Df** is a dilution factor (1 if no dilutions are made), **RRF** is the relative response factor (assumed to be 1 for non target analytes) and **MW** is the molecular weight of the compound of interest.

Case Narrative

Method:	**TO15**	**Client:**	CH2M
Analysis:	**VOA**		
Preparation SOP #:	**IH-AN-014 (SIM)**	**Matrix:**	**Air**
Work Order:	**1709321 (SIM)**		

Analysis / Method: Method TO15 is an EPA method used in the analysis of air samples for volatile organics by GC/MS, which have been sampled in a silonized canister.

General Set Information: ALS received four summa canisters for VOA analysis. The samples were analyzed within thirty days of sampling. Recoveries of target analytes are reported on the Sample Analysis Data Sheet in units of ppb v/v and μg/m³.

Sample Preparation: This method has no extraction procedure for air samples. The sample preparation date is the same as the date of analysis. Two hundred milliliters of air sample and 50 milliliters of Internal Standard were trapped using an Entech 7100 microscale purge and trap concentrator.

Instrument Calibration: 4-Bromofluorobenzene calibration is not required for SIM analysis.

Initial and Continuing Calibration Verification: The initial calibration curve, which was analyzed prior to sample analysis, met the specified criteria of the SOP. For the initial calibration curve, the %RSD of the response factors for the TO-15 analytes were checked.

A continuing calibration standard (CCS) was analyzed prior to sample analysis. The CCS met the criteria as specified in the SOP.

Method Blank Analysis: A laboratory method blank was prepared using 200 milliliters of humidified ultra high purity nitrogen and 50 milliliters of Internal Standards and analyzed prior to sample analysis. The blank was free of volatile organic contaminants.

Comments

Workorder: 1709321

Compound flagged with an "E" qualifier had no peak saturation and is considered to be an estimated value.

Quality Control: EPA TO-15 - (HBN: 188619)

The following compounds in the CCV were outside of +/-30%: Freon 114, Freon 113, Carbon Tetrachloride, Dibromochloromethane and Tetrachloroethane.

General Lab Comments

The results provided in this report relate only to the items tested.
Samples were received in acceptable condition unless otherwise noted.
Samples have not been blank corrected unless otherwise noted.
This test report shall not be reproduced, except in full, without written approval of ALS.

ALS provides professional analytical services for all samples submitted. ALS is not in a position to interpret the data and assumes no responsibility for the quality of the samples submitted.

All quality control samples processed with the samples in this report yielded acceptable results unless otherwise noted.

ALS is accredited for specific fields of testing (scopes) in the following testing sectors. The quality system implemented at ALS conforms to accreditation requirements and is applied to all analytical testing performed by ALS. The following table lists testing sector, accreditation body, accreditation number and website. Please contact these accrediting bodies or your ALS project manager for the current scope of accreditation that applies to your analytical testing.

ANALYTICAL REPORT

Workorder: 34-1709321
Client: CH2M
Project Manager: Kevin W. Griffiths

Result Symbol Definitions

MDL = Method Detection Limit, a statistical estimate of method/media/instrument sensitivity.
RL = Reporting Limit, a verified value of method/media/instrument sensitivity.
CRDL = Contract Required Detection Limit
Reg. Limit = Regulatory Limit.
ND = Not Detected, testing result not detected above the MDL or RL.
< This testing result is less than the numerical value.
** No result could be reported, see sample comments for details.

Qualifier Symbol Definitions

U = Qualifier indicates that the analyte was not detected above the MDL.
J = Qualifier Indicates that the analyte value is between the MDL and the RL. It is also used to indicate an estimated value for tentatively identified compounds in mass spectrometry where a 1:1 response is assumed.
B = Qualifier indicates that the analyte was detected in the blank.
E = Qualifier indicates that the analyte result exceeds calibration range.
P = Qualifier indicates that the RPD between the two columns is greater than 40%.

Symbols and Definitions

* - Analyte above reporting limit or outside of control limits
▲ - Sample result is greater than 4 times the spike added
◆ - Sample and Matrix Duplicate less than 5 times the reporting limit
● - Result is above the calibration range
- The Matrix Spike, Matrix Spike duplicate or Matrix Duplicate is reported for your information only. The sample matrix may be inappropriate for the method selected.

RPD - Relative % Difference (Spike / Spike Duplicate)
ND - Not Detected (U - Qualifier also flags analyte as not detected)
NA - Not Applicable
QC results are not adjusted for moisture correction, where applicable

Sample Acceptance Check Form

Client: CH2MHill Work order:

Project: VA AOU1 (SLC, UT)

Sample(s) received on: 3/31/2017 Date opened: 4/3/2017 by: Julie Warath/Kevin Gr

Note: This form is used for all samples received by ALS. The use of this form for custody seals is strictly meant to indicate presence/absence and not as an indication of compliance or nonconformity. Thermal preservation and pH will only be evaluated either at the request of the client and/or as required by the method/SOP.

		Yes	No	N/A
1	Were **sample containers** properly marked with client sample ID?	☒	☐	☐
2	Did **sample containers** arrive in good condition?	☒	☐	☐
3	Were **chain-of-custody** papers used and filled out?	☒	☐	☐
4	Did **sample container labels** and/or tags agree with custody papers?	☒	☐	☐
5	Was **sample volume** received adequate for analysis?	☒	☐	☐
6	Are samples within specified holding times?	☒	☐	☐
7	Was proper **temperature** (thermal preservation) of cooler at receipt adhered to?	☐	☐	☒
8	Were **custody seals** on outside of cooler/Box/Container?	☐	☒	☐
	Location of seal(s)? _____ Sealing Lid?	☐	☐	☒
	Were signature and date included?	☒	☐	
	Were seals intact?	☐	☐	☒
9	Do containers have appropriate **preservation**, according to method/SOP or Client specified information?	☐	☐	☒
	Is there a client indication that the submitted samples are **pH** preserved?	☐	☐	☒
	Were **VOA vials** checked for presence/absence of air bubbles?	☐	☐	☒
	Does the client/method/SOP require that the analyst check the sample pH and if necessary alter it?	☐	☐	☒
10	**Tubes:** Are the tubes capped and intact?	☐	☐	☒
11	**Badges:** Are the badges properly capped and intact?	☐	☐	☒
	Are dual bed badges separated and individually capped and intact?	☐	☐	☒

Analyst Notebook

1886019

TO15
Instrument : See Batch Worklist
HBN: See Batch Worklist
Column: DB-1
Inst. Program: Initial 40 °C for 4 min; 10 °C/min to 220 °C hold for 3 mins.
Run time: 26 min for 5975-K, 25 min for 5975-L
Carrier Gas: Helium
Cold Trap Dehydration
Initial Calibration Curve is : TO15LL1Co (HBN 180857)

The following compounds in the CCS were outside of +/_30%: From 114, From 113, Carbon Tetrachloride, Dibromochloromethane and Tetrachloroethane

Dilutions: 1709670 = HDS; 1.10DIL x % Air Calculator Worksheet

Notes: 1710039, 1709670, 1709321

1709670 = Hexane and Benzene ~~only for TEP 04-13-17~~ 04-12-17
Client also wanted Propane/Propene, Isobutane, Butane, 1,3-Butadiene and Acetone

Analyst Signature: 04-12-17

1709321

For lab use only

ANALYTICAL REQUEST FORM

1. ☒ REGULAR Status

☐ RUSH Status Requested - ADDITIONAL CHARGE
RESULTS REQUIRED BY _____
DATE
CONTACT ALS SALT LAKE PRIOR TO SENDING SAMPLES

2. Date _____ Purchase Order No. 10006-7-107234

3. Company Name CHEM HILL
Address 4246 S. Riverboat Rd Suite 210
Taylorsville, UT 84123
Person to Contact Mark Ciehy
Telephone (801) 229-3744
Fax Telephone ( )
E-mail Address Mark.Ciehy@chem.com
Billing Address (if different from above)

4. Quote No. 80020655-R17-0003
ALS Project Manager Kevin Griffith

5. Sample Collection
Sampling Site HA Army (SLC, UT)
Industrial Process Residential Indoor Air
Date of Collection
Time Collected
Date of Shipment Dropped off @ Lab
Chain of Custody No. 002

6. How did you first learn about ALS?

7. REQUEST FOR ANALYSES

Date Received: 05/01/17

Required Documentation	Yes	No	Comments
1. Cover letter complete with the following information:	X		Cover is Case Narrative.
• Title of report and laboratory unique report identification (sample delivery group number)	X		Title of report and project name are absent. SDG ID present.
• Project name, site location		X	
• Name and location of laboratory and second-site or subcontracted laboratory	X		
• Client name and address	X		Client name was included. No address was present for the client on the cover letter.
• Statement of authenticity and official signature and title of person authorizing report release	X		Electronic signature at the end of "Analytical Results" section
2. Summary of samples received that correlates field sample IDs with the laboratory IDs	X		
3. Laboratory qualifier flags and definitions	X		
4. Preparation and/or analytical methods	X		
5. Sample results for each analyte (dry weight basis for soils)			
• Date received	X		
• Date analyzed (and time of analysis if the holding time is less than or equal to 48 hours)	X		
• Percent solids results for soil samples			N/A
• Dilution factor (provide both diluted and undiluted results when available)	X		
• Sample-specific reporting limit adjusted for sample size, dilution/concentration	X		
• Sample-specific MDL adjusted for sample size, dilution/concentration	X		MDL and RL only in ppb
• Units	X		
6. Case Narrative that addresses the following information at a minimum:		X	See comment for Item 1 above
• Sample receipt discrepancies	X		See Sample Acceptance Check Form for any noted discrepancies
• Descriptions of all non conformances in the sample receipt, handling, preparation, analytical and reporting processes and the corrective action taken in each occurrence	X		
• Identification and justification for sample dilution	X		No dilutions.
• Sample cooler temperature at time of receipt			N/A
• Final residual vacuum of each sample canister immediately prior to analysis, or upon receipt (Air analyses only)	X		On "Sample Acceptance Check Form".

Required Documentation	Yes	No	Comments
7. Surrogate percent recoveries (surrogate result, target concentration, percent recovery)	X		
8. MS/MSD and LCS spike concentrations, native sample results, spiked sample results, percent recoveries, and RPDs between the MS and MSD results (associated QC limits must also be provided)	X		*MS/MSDs not applicable to Air analyses.*
9. Method blank results	X		
10. Analytical batch reference number that cross references samples to QC sample analyses	X		Batch ID present.
11. Executed COC and sample receipt checklist	X		
12. Analytical sequence or laboratory run log that contains sufficient information to correlate samples reported in the summary results to the associated method QC information, such as initial and continuing calibration analyses	X		
13. Calibration blank results for inorganic analyses (required in hardcopy format only)			N/A
14. Inductively coupled plasma (ICP) interference check sample for inorganic analyses, true and measured concentrations and percent recoveries (required in hardcopy format only)			N/A
15. Reporting Limit Check Standard for inorganic analyses, true and measured concentrations and percent recoveries (if applicable, required in hardcopy format only)			N/A
16. Post-digestion spike recoveries for inorganic analyses, (if applicable; required in hardcopy format only)			N/A
17. Internal Standard recovery and retention time information, as applicable.	X		
18. Initial calibration summary, including standard concentrations, response factors, average response factors, RSDs or correlation coefficients, and calibration plots or equations, if applicable (required in hardcopy format only)	X		
19. Continuing calibration verification summary, including expected and recovered concentrations and percent differences (required in hardcopy format only)	X		
20. Instrument tuning and mass calibration information for ICP/mass spectrometry analyses	X		
21. All associated instrument printouts for all samples, standards, and QC samples (e.g., raw data) necessary to re-calculate results as well as all manual integrations (if performed)	X		
22. Sample preparation logs that include the following information			*Not applicable to Air analyses*
• Preparation start and end times			N/A
• Beginning and ending temperatures of water baths and digestion blocks			N/A

Case Narrative

Method:	**TO15**	**Client:**	CH2M Hill
Analysis:	**VOA**		
Preparation SOP #:	**IH-AN-014**	**Matrix:**	**Air**
Work Order:	**1710499**		

Analysis / Method: Method TO15 is an EPA method used in the analysis of air samples for volatile organics by GC/MS, which have been sampled in a silonized canister.

General Set Information: ALS received three summa canisters for VOA analysis. The samples were analyzed within thirty days of sampling. Recoveries of target analytes are reported on the Sample Analysis Data Sheet in units of ppb v/v and μg/m³.

Sample Preparation: This method has no extraction procedure for air samples. The sample preparation date is the same as the date of analysis. Two hundred milliliters of air sample and 100 milliliters of Internal Standard were trapped using an Entech 7100 microscale purge and trap concentrator.

Instrument Calibration: The GC/MS was hardware tuned to meet the criteria for 4-Bromofluorobenzene as specified in the SOP. This tune check is valid for 24 hours.

Initial and Continuing Calibration Verification: The initial calibration curve, which was analyzed prior to sample analysis, met the specified criteria of the SOP. For the initial calibration curve, the %RSD of the response factors for the TO-15 analytes were checked.

A continuing calibration standard (CCS) was analyzed prior to sample analysis. The CCS met the criteria as specified in the SOP.

Method Blank Analysis: A laboratory method blank was prepared using 200 milliliters of humidified ultra high purity nitrogen and 100 milliliters of Internal Standards and analyzed prior to sample analysis. The blank was free of volatile organic contaminants.

Data Qualifier Codes: A "J" qualifier indicates that the result is greater than the MDL but less than the PQL. Analytes found in field samples, which also appear in the method blank above the PQL are reported with a "B" qualifier in the flag column. The "E" qualifier indicates a reported value above the analytical linear range.

LCS/LCSD: An LCS and LCSD pair was analyzed for the analytical batch.

Dilutions: 1710499003 was diluted 1:10 for toluene.

NC/CAR: None.

Miscellaneous Comments: Instrument designation is HP5972-L. Field samples were analyzed using auto sampler positions that were free from volatile contaminants. The "E" qualifier indicates a reported value above the analytical linear range.

Sample Calculations: Target Compounds

Relative Response Factor: $$\mathbf{RRF} = \left[\frac{A_x}{A_{is}}\right]\left[\frac{C_{is}}{C_x}\right]$$

Where $\mathbf{A_x}$ is the area of the characteristic ion for the compound to be measured, $\mathbf{A_{is}}$ is the area of the characteristic ion for the internal standard , $\mathbf{C_{is}}$ is the concentration of the internal standard, and $\mathbf{C_x}$ is the concentration of the compound to be measured.

Concentration in ppb v/v: $$C = \left[\frac{(A_x)\,(I_s)\,(Df)}{(A_{is})\,(RRF)}\right]$$

Concentration in ug/m^3 : $$C = \mathbf{ppb\ v/v\ (MW/24.45)}$$

Where $\mathbf{I_s}$ is the amount of internal standard spiked in ppb, **Df** is a dilution factor (1 if no dilutions are made), **RRF** is the relative response factor (assumed to be 1 for non target analytes) and **MW** is the molecular weight of the compound of interest.

Environmental Division

Case Narrative

Method:	**TO15**	**Client:**	CH2M
Analysis:	**VOA**		
Preparation SOP #:	**IH-AN-014 (SIM)**	**Matrix:**	**Air**
Work Order:	**1710499 (SIM)**		

Analysis / Method: Method TO15 is an EPA method used in the analysis of air samples for volatile organics by GC/MS, which have been sampled in a silonized canister.

General Set Information: ALS received three summa canisters for VOA analysis. The samples were analyzed within thirty days of sampling. Recoveries of target analytes are reported on the Sample Analysis Data Sheet in units of ppb v/v and $\mu g/m^3$.

Sample Preparation: This method has no extraction procedure for air samples. The sample preparation date is the same as the date of analysis. Two hundred milliliters of air sample and 50 milliliters of Internal Standard were trapped using an Entech 7100 microscale purge and trap concentrator.

Instrument Calibration: 4-Bromofluorobenzene calibration is not required for SIM analysis.

Initial and Continuing Calibration Verification: The initial calibration curve, which was analyzed prior to sample analysis, met the specified criteria of the SOP. For the initial calibration curve, the %RSD of the response factors for the TO-15 analytes were checked.

A continuing calibration standard (CCS) was analyzed prior to sample analysis. The CCS met the criteria as specified in the SOP.

Method Blank Analysis: A laboratory method blank was prepared using 200 milliliters of humidified ultra high purity nitrogen and 50 milliliters of Internal Standards and analyzed prior to sample analysis. The blank was free of volatile organic contaminants.

Data Qualifier Codes: Analytes found in field samples, which also appear in the method blank above the PQL are reported with a "B" qualifier in the flag column. The "E" qualifier indicates a reported value above the analytical linear range.

LCS/LCSD: An LCS and LCSD pair was analyzed for the analytical batch.

Dilutions: None

NC/CAR: None.

Miscellaneous Comments: Instrument designation is HP5972-L. Field samples were analyzed using auto sampler positions that were free from volatile contaminants. The "E" qualifier indicates a reported value above the analytical linear range. The internal standard response for sample 1710499003 failed to meet criteria. This sample was analyzed twice with the same results. In the analyst opinion this is caused by the high hydrocarbon content in the sample.

Sample Calculations: Target Compounds

Relative Response Factor: $$RRF = \left[\frac{A_x}{A_{is}}\right]\left[\frac{C_{is}}{C_x}\right]$$

Where A_x is the area of the characteristic ion for the compound to be measured, A_{is} is the area of the characteristic ion for the internal standard , C_{is} is the concentration of the internal standard, and C_x is the concentration of the compound to be measured.

Concentration in ppb v/v: $$C = \left[\frac{(A_x)\,(I_s)\,(Df)}{(A_{is})\,(RRF)}\right]$$

Concentration in ug/m^3 : $$C = \textbf{ppb v/v (MW/24.45)}$$

Where I_s is the amount of internal standard spiked in ppb, **Df** is a dilution factor (1 if no dilutions are made), **RRF** is the relative response factor (assumed to be 1 for non target analytes) and **MW** is the molecular weight of the compound of interest.

ANALYTICAL REPORT

General Lab Comments

The results provided in this report relate only to the items tested.
Samples were received in acceptable condition unless otherwise noted.
Samples have not been blank corrected unless otherwise noted.
This test report shall not be reproduced, except in full, without written approval of ALS.

ALS provides professional analytical services for all samples submitted. ALS is not in a position to interpret the data and assumes no responsibility for the quality of the samples submitted.

All quality control samples processed with the samples in this report yielded acceptable results unless otherwise noted.

ALS is accredited for specific fields of testing (scopes) in the following testing sectors. The quality system implemented at ALS conforms to accreditation requirements and is applied to all analytical testing performed by ALS. The following table lists testing sector, accreditation body, accreditation number and website. Please contact these accrediting bodies or your ALS project manager for the current scope of accreditation that applies to your analytical testing.

Result Symbol Definitions

MDL = Method Detection Limit, a statistical estimate of method/media/instrument sensitivity.
RL = Reporting Limit, a verified value of method/media/instrument sensitivity.
CRDL = Contract Required Detection Limit
Reg. Limit = Regulatory Limit.
ND = Not Detected, testing result not detected above the MDL or RL.
< This testing result is less than the numerical value.
** No result could be reported, see sample comments for details.

Qualifier Symbol Definitions

U = Qualifier indicates that the analyte was not detected above the MDL.
J = Qualifier Indicates that the analyte value is between the MDL and the RL. It is also used to indicate an estimated value for tentatively identified compounds in mass spectrometry where a 1:1 response is assumed.
B = Qualifier indicates that the analyte was detected in the blank.
E = Qualifier indicates that the analyte result exceeds calibration range.
P = Qualifier indicates that the RPD between the two columns is greater than 40%.

Symbols and Definitions

* - Analyte above reporting limit or outside of control limits
▲ - Sample result is greater than 4 times the spike added
◆ - Sample and Matrix Duplicate less than 5 times the reporting limit
● - Result is above the calibration range
- The Matrix Spike, Matrix Spike duplicate or Matrix Duplicate is reported for your information only. The sample matrix may be inappropriate for the method selected.

RPD - Relative % Difference (Spike / Spike Duplicate)
ND - Not Detected (U - Qualifier also flags analyte as not detected)
NA - Not Applicable
QC results are not adjusted for moisture correction, where applicable

QC Report Authorization (/S/ is an electronic signature that complies with 21 CFR Part 11)

Analyst	Peer Review
/S/ Jorden Baum	/S/ Lisa M. Reid
04/28/2017 11:23	04/28/2017 15:18

Symbols and Definitions

- * - Analyte above reporting limit or outside of control limits
- ▲ - Sample result is greater than 4 times the spike added
- ◒ - Sample and Matrix Duplicate less than 5 times the reporting limit
- ● - Result is above the calibration range
- # - The Matrix Spike, Matrix Spike duplicate or Matrix Duplicate is reported for your information only. The sample matrix may be inappropriate for the method selected.

RPD - Relative % Difference (Spike / Spike Duplicate)
ND - Not Detected (U - Qualifier also flags analyte as not detected)
NA - Not Applicable
QC results are not adjusted for moisture correction, where applicable

ANALYTICAL REQUEST FORM

1. ☑ REGULAR Status 14 day TAT

☐ RUSH Status Requested - ADDITIONAL CHARGE
RESULTS REQUIRED BY _____ DATE
CONTACT ALS SALT LAKE PRIOR TO SENDING SAMPLES

2. Date 4/14/17 Purchase Order No. 10068-7-107234 4. Quote No. 80220655-RA7-0003

3. Company Name CHEM HILL ALS Project Manager Kevin Griffith

Address 4246 S. Riverboat Rd, STE 210 5. Sample Collection
Taylorsville, UT 84123

Person to Contact Mark Croby Sampling Site HA ARMY (SLC, UT)

Telephone (530) 229-3279 Industrial Process Residential Indoor Air

Fax Telephone ( ) Date of Collection 3/23/17 & 4/14/17

E-mail Address Mark.Croby@chem.com Time Collected

Billing Address (if different from above) Date of Shipment Dropped off @ Lab

Chain of Custody No. 003

6. How did you first learn about ALS?

7. REQUEST FOR ANALYSES

Client Sample Number	Matrix*	Sample/Area Volume	ANALYSES REQUESTED - Use method number if known	Units**	Lab Comments

Sample Acceptance Check Form

Client: CH2MHill Work order: _____

Project: VA AOU1 (SLC, UT)

Sample(s) received on: 4/14/2017 Date opened: 4/14/2017 by: Kevin Griffiths

Note: This form is used for all samples received by ALS. The use of this form for custody seals is strictly meant to indicate presence/absence and not as an indication of compliance or nonconformity. Thermal preservation and pH will only be evaluated either at the request of the client and/or as required by the method/SOP.

		Yes	No	N/A
1	Were **sample containers** properly marked with client sample ID?	☒	☐	☐
2	Did **sample containers** arrive in good condition?	☒	☐	☐
3	Were **chain-of-custody** papers used and filled out?	☒	☐	☐
4	Did **sample container labels** and/or tags agree with custody papers?	☒	☐	☐
5	Was **sample volume** received adequate for analysis?	☒	☐	☐
6	Are samples within specified holding times?	☒	☐	☐
7	Was proper **temperature** (thermal preservation) of cooler at receipt adhered to?	☐	☐	☒
8	Were **custody seals** on outside of cooler/Box/Container?	☐	☒	☐
	Location of seal(s)? _____ Sealing Lid?	☐	☐	☒
	Were signature and date included?	☒	☐	
	Were seals intact?	☐	☐	☒
9	Do containers have appropriate **preservation**, according to method/SOP or Client specified information?	☐	☐	☒
	Is there a client indication that the submitted samples are **pH** preserved?	☐	☐	☒
	Were **VOA vials** checked for presence/absence of air bubbles?	☐	☐	☒
	Does the client/method/SOP require that the analyst check the sample pH and if necessary alter it?	☐	☐	☒
10	**Tubes:** Are the tubes capped and intact?	☐	☐	☒
11	**Badges:** Are the badges properly capped and intact?	☐	☐	☒
	Are dual bed badges separated and individually capped and intact?	☐	☐	☒

Client Sample ID	Container Description	Required pH *	Received pH	Adjusted pH	VOA Headspace (Presence/Absence)	Receipt / Preservation Comments

TO15 SIM HBN: 189596
Workorder#'s: 1710499001-003
Sample#'s:

Instrument: 5975 L
Column: DB-1
Inst. Program: Initial 40 °C for 4 min; 10 °C/min to 220 °C hold for 3 mins.
Run time: 26 min for 5975-K, 25 min for 5975-L
Carrier Gas: Helium
Cold Trap Dehydration
Initial Calibration Curve is: TO15LSIM A17 (HBN 18783)

The following compounds in the CCS were outside of +/_30%: NA

Dilutions: NA

Notes: The ISTD response for sample 1710499003 failed to meet criteria. This sample was analyzed twice with the same results. In the analysts opinion this is caused by the high HC content of the sample.

Analyst Signature: 04-28-17

Created: Fri Apr 28 10:58:17 2017 5975-L

The ISTD response for 1710499003 failed to meet criteria. This sample was analyzed twice with similar results. In the analysts opinion, it is caused by the high hydrocarbon content in the sample.

Initial Calibration

Samples A-0004H-031417-TO-001-BAS, A-0012H-031417-TO-001-BAS, A-0013H-031017-TO-001-BAS, A-0025H-031417-TO-001-BAS, A-0026H-031617-TO-001-LIV, A-0027H-031017-TO-001-BAS, A-0027H-031017-TO-002-BAS, 1,2,4-Trichlorobenzene %RSD 34.22 vs. 30, Bromoform %RSD 30.06 vs. 30, exceeded criteria. Instrument: 5975-L Cal Date: 11/17/2016. Since only two target compounds exceeded 30% RSD (method allows 2 compounds above 30%), initial calibration met method criteria and associated non-detects were not qualified

Continuing Calibration

All acceptance criteria were met.

9. Holding Time

All acceptance criteria were met.

10. Confirmation

None for this SDG.

11. Summary

General Comments

All acceptance criteria were met.

Data Package Completeness

Package was complete for Tier 2B validation.

Forms Review/ Items of Interest

No samples were excluded for dilutions or re-extractions.

COC Review

No discrepancies were noted. Final canister pressures were recorded upon receipt

Validated Form I

Final Data Flags*

***When the data evaluation process results in multiple flags, the most severe flag becomes the final data flag. All flags are from the site-specific QAPP, except the "exclude" flag that is used to designate results that are not for risk assessment (for example, a result from a dilution where the original undiluted result is appropriate).**

Final Data Flags*

***When the data evaluation process results in multiple flags, the most severe flag becomes the final data flag. All flags are from the site-specific QAPP, except the "exclude" flag that is used to designate results that are not for risk assessment (for example, a result from a dilution where the original undiluted result is appropriate).**

1. Case Narrative Items of Interest

Results for Acetone in Samples A-0001H-032317-TO-001-BAS and A-0001H-032317-TO-002-BAS exceeded the upper calibration range. Lab qualifed results ("E" flag)

2. Blank Summary

Field Blanks No Field Blanks were found.

Method Blanks No Method Blank detects were found.

3. Spikes and Duplicates

Field Duplicates No FD Associated.

Laboratory Duplicates None in this SDG

Matrix Spike No MS's for this SDG. No SD's for this SDG.

4. Laboratory Control Sample

These LCS analytes were out of control: Carbon tetrachloride (BD), Carbon tetrachloride (BS), Dibromochloromethane (BS), Freon 113 (BD), Freon 113 (BS), Freon 114 (BS). Since recoveries exceeded the UCL for the compounds listed, detected concentrations were qualified as estimated and flagged "J" and non-detects were not qualified ("None" flag). All RPD acceptance criteria were met. During Tier 4 validation, the LCS (LN48LCS) concentrations for Trichlorofluoromethane (Freon 11), methylene chloride, and 1,1,1-TCA were re-calculated from the raw data values using average response factor and the following formula: (%rec = conc LCS/TV x 100%). All within criteria of 70 - 130% of true value.

Matrix	QAQC Type	Field ID	Analyte	Recovery	Lower Limit	Upper Limit

AIR	BS	544177	Carbon tetrachloride	137.92	70	130
AIR	BS	544177	Dibromochloromethane	134	70	130
AIR	BS	544177	Freon 113	132.62	70	130
AIR	BS	544177	Freon 114	130.75	70	130

8. Calibration Information

Initial Calibration

Samples A-0001H-032317-TO-001-BAS, A-0001H-032317-TO-002-BAS, A-0002H-032317-TO-001-BAS, A-0029H-033117-TO-001-BAS, 1,2,4-Trichlorobenzene RSD 34.2% vs. 30, Bromoform RSD 30.1% vs. 30, exceeded criteria. Instrument: 5975-L Cal Date: 11/17/2016. Since only two target compounds exceeded 30% RSD (method allows 2 compounds above 30%), initial calibration met method criteria and associated non-detects were not qualified ("None" flag). Results for Acetone in Samples A-0001H-032317-TO-001-BAS and A-0001H-032317-TO-002-BAS exceeded the upper calibration range. Samples were not re-analyzed on a diluted basis. Therefore, associated detects were qualifed as estimated and flagged "J". During Tier 4 validation, the initial calibration was re-calculated from the raw data values using response factors and the following formula: (RespFactor = StdResponse/ISResponse x ISConc/StdConc). Reported response factors were confirmed, as well as mean RRF and %RSD (StdDev/mean RRF x 100%). No discrepancies were noted.

Continuing Calibration

Samples A-0001H-032317-TO-001-BAS, A-0001H-032317-TO-002-BAS, A-0002H-032317-TO-001-BAS, A-0029H-033117-TO-001-BAS, Carbon tetrachloride %D 37.9% vs. 30, exceeded criteria. Instrument: 5975-L Cal Date: 4/10/2017. Since UCL was exceeded, associated detects were qualifed as estimated and flagged "J". During Tier 4 validation, CCV LN48LCS was re-calculated for Trichlorofluoromethane (Freon 11), methylene chloride, and 1,1,1-TCA using response factors and the following formula: (RespFactor = StdResponse/ISResponse x ISConc/StdConc). Reported CCV response factors were confirmed.

Flagging Category

Continuing calibration recovery greater than the upper control limit

Instrument	*Date*	*Field ID*	*Analyte*	*Validation Flag*
5975-L	4/10/2017	A-0001H-032317-TO-002-BAS	Carbon tetrachloride	J
5975-L	4/10/2017	A-0001H-032317-TO-001-BAS	Carbon tetrachloride	J

Flagging Category

Initial calibration RSD exceeded

Instrument	*Date*	*Field ID*	*Analyte*	*Validation Flag*
5975-L	11/17/2016	A-0029H-033117-TO-001-BAS	1,2,4-Trichlorobenzene	None
5975-L	11/17/2016	A-0002H-032317-TO-001-BAS	1,2,4-Trichlorobenzene	None
5975-L	11/17/2016	A-0001H-032317-TO-002-BAS	1,2,4-Trichlorobenzene	None

11. Summary

General Comments

1. Initial Calibration: Samples A-0001H-032317-TO-001-BAS, A-0001H-032317-TO-002-BAS, A-0002H-032317-TO-001-BAS, A-0029H-033117-TO-001-BAS, 1,2,4-Trichlorobenzene RSD 34.2% vs. 30, Bromoform RSD 30.1% vs. 30, exceeded criteria. Instrument: 5975-L Cal Date: 11/17/2016. Since only two target compounds exceeded 30% RSD (met;hod allows 2 compounds above 30%), initial calibration met method criteria and associated non-detects were not qualified ("None" flag). Results for Acetone in Samples A-0001H-032317-TO-001-BAS and A-0001H-032317-TO-002-BAS exceeded the upper calibration range. Samples were not re-analyzed on a diluted basis. Therefore, associated detects were qualifed as estimated and flagged "J".
2. Continuing Calibration: Samples A-0001H-032317-TO-001-BAS, A-0001H-032317-TO-002-BAS, A-0002H-032317-TO-001-BAS, A-0029H-033117-TO-001-BAS, Carbon tetrachloride %D 37.9% vs. 30, exceeded criteria. Instrument: 5975-L Cal Date: 4/10/2017. Since UCL was exceeded, associated detects were qualifed as estimated and flagged "J".
3. These LCS analytes were out of control: Carbon tetrachloride (BD), Carbon tetrachloride (BS), Dibromochloromethane (BS), Freon 113 (BD), Freon 113 (BS), Freon 114 (BS). Since recoveries exceeded the UCL for the compounds listed, detected concentrations were qualified as estimated and flagged "J" and non-detects were not qualified ("None" flag).

Data Package Completeness

Package was complete for Tier 4 validation

Forms Review/ Items of Interest

No samples were excluded for dilutions or re-extractions. During Tier 4 validation, the sample results for Trichlorofluoromethane (Freon 11), methylene chloride, and 1,1,1-TCA in sample A-0002H-032317-TO-001-BAS were re-calculated from the raw data values using average response factor and the following formula: (Conc = SampleResponse/ISResponse x ISConc/AveRspFactor). Sample results were confirmed.

COC Review

No discrepancies were noted. Final canister pressures were recorded upon receipt

Validated Form I

Final Data Flags*

***When the data evaluation process results in multiple flags, the most severe flag becomes the final data flag. All flags are from the site-specific QAPP, except the "exclude" flag that is used to designate results that are not for risk assessment (for example, a result from a dilution where the original undiluted result is appropriate).**

1. Case Narrative Items of Interest

No comments were made

2. Blank Summary

Field Blanks No Field Blanks were found.

Method Blanks No Method Blank detects were found.

3. Spikes and Duplicates

Field Duplicates No FD Associated.

Laboratory Duplicates None in this SDG

Matrix Spike No MS's for this SDG. No SD's for this SDG.

4. Laboratory Control Sample

All acceptance criteria were met. During Tier 4 validation, the LCS (LN63S05) concentration for Trichloroethene was re-calculated from the raw data values using average response factor and the following formula: (%rec = conc LCS/TV x 100%). Within criteria of 70 - 130% of true value.

5. Surrogates

All acceptance criteria were met.

6. Tuning and Mass Calibration

All acceptance criteria were met.

7. Internal Standard

All acceptance criteria were met.

8. Calibration Information

Initial Calibration

All acceptance criteria were met. During Tier 4 validation, the initial calibration was re-calculated from the raw data values using response factors and the following formula: (RespFactor = StdResponse/ISResponse x ISConc/StdConc). Reported response factors were confirmed, as well as mean RRF and %RSD (StdDev/mean RRF x 100%). No discrepancies were noted..

Continuing Calibration

All acceptance criteria were met. During Tier 4 validation, CCV LN63S05 was re-calculated for Trichloroethene using response factors and the following formula: (RespFactor = StdResponse/ISResponse x ISConc/StdConc). Reported CCV response factor was confirmed.

9. Holding Time

All acceptance criteria were met.

10. Confirmation

N/A

11. Summary

General Comments

All acceptance criteria were met.

Data Package Completeness

Data package complete for Tier 4 validation

Forms Review/ Items of Interest

No samples were excluded for dilutions or re-extractions. During Tier 4 validation, the sample results for Trichloroethene in sample A-0002H-032317-TO-001-BAS was re-calculated from the raw data values using average response factor and the following formula: (Conc = SampleResponse/ISResponse x ISConc/AveRspFactor). Sample result was confirmed.

COC Review

No discrepancies were noted

Validated Form I

Final Data Flags*

***When the data evaluation process results in multiple flags, the most severe flag becomes the final data flag. All flags are from the site-specific QAPP, except the "exclude" flag that is used to designate results that are not for risk assessment (for example, a result from a dilution where the original undiluted result is appropriate).**

1. Case Narrative Items of Interest

There were no items of concern.

2. Blank Summary

Field Blanks No Field Blanks were found.

Method Blanks No Method Blank detects were found.

3. Spikes and Duplicates

Field Duplicates All acceptance criteria were met.

Laboratory Duplicates None in this SDG

Matrix Spike No MS's for this SDG. No SD's for this SDG. MS RPD: None for this SDG.

4. Laboratory Control Sample

All acceptance criteria were met.

5. Surrogates

All acceptance criteria were met.

6. Tuning and Mass Calibration

All acceptance criteria were met.

7. Internal Standard

All acceptance criteria were met.

8. Calibration Information

Initial Calibration

Samples A-0038H-041117-TO-001-BAS, A-0038H-041117-TO-002-BAS, A-0064H-041417-TO-001-LIV, 1,2,4-Trichlorobenzene %RSD 48.29 vs. 30, Benzyl chloride %RSD 43.23 vs. 30, exceeded criteria. Instrument: 5975-L Cal Date: 03/21/2017. The associated non-detects were qualified as estimated and flagged "UJ".

Continuing Calibration

All acceptance criteria were met.

Flagging Category

Initial calibration RSD exceeded

Instrument	*Date*	*Field ID*	*Analyte*	*Validation Flag*
		A-0064H-041417-TO-001-LIV	1,2,4-Trichlorobenzene	UJ
		A-0038H-041117-TO-002-BAS	1,2,4-Trichlorobenzene	UJ
		A-0038H-041117-TO-001-BAS	1,2,4-Trichlorobenzene	UJ
		A-0064H-041417-TO-001-LIV	Benzyl chloride	UJ
		A-0038H-041117-TO-002-BAS	Benzyl chloride	UJ
		A-0038H-041117-TO-001-BAS	Benzyl chloride	UJ

9. Holding Time

All acceptance criteria were met.

10. Confirmation

None for this SDG.

11. Summary

General Comments

1.) Samples A-0038H-041117-TO-001-BAS, A-0038H-041117-TO-002-BAS, A-0064H-041417-TO-001-LIV, 1,2,4-Trichlorobenzene %RSD 48.29 vs. 30, Benzyl chloride %RSD 43.23 vs. 30, exceeded criteria. The ICAL %RSD exceedances were greater than 40% acceptance criteria; the assocaited sample non-detect results were flagged "UJ".

Data Package Completeness

Package was complete for Tier 2B validation.

Forms Review/ Items of Interest

No samples were excluded for dilutions or re-extractions.

COC Review

No discrepancies were noted. Final canister pressures were recorded upon receipt

Validated Form I

Final Data Flags*

***When the data evaluation process results in multiple flags, the most severe flag becomes the final data flag. All flags are from the site-specific QAPP, except the "exclude" flag that is used to designate results that are not for risk assessment (for example, a result from a dilution where the original undiluted result is appropriate).**

1. Case Narrative Items of Interest

1.) The internal standard response for sample 1710499003 failed to meet criteria. This sample was analyzed twice with the same results.

2. Blank Summary

Field Blanks No Field Blanks were found.

Method Blanks No Method Blank detects were found.

3. Spikes and Duplicates

Field Duplicates All acceptance criteria were met.

Laboratory Duplicates None in this SDG

Matrix Spike No MS's for this SDG. No SD's for this SDG. MS RPD: None for this SDG.

4. Laboratory Control Sample

All acceptance criteria were met.

5. Surrogates

All acceptance criteria were met.

6. Tuning and Mass Calibration

All acceptance criteria were met.

7. Internal Standard

For sample A-0064H-041417-TO-001-LIV, the Internal Standard recovery was high indicating a potential low bias in the sample resullts. Sample was re-analyzed with similar results. Associated detects and non-detects were qualified as estimated and flagged "J" and "UJ" respectively.

Field ID	*Analyte*	*Validation Flag*	*Validation Reason*
A-0064H-04141	1,4-Dioxane	UJ	IS>UCL
A-0064H-04141	4-Bromofluorobenzene	J	IS>UCL

A-0064H-04141	Trichloroethene	UJ	IS>UCL
A-0064H-04141	Vinyl chloride	UJ	IS>UCL

8. Calibration Information

Initial Calibration All acceptance criteria were met.

Continuing Calibration All acceptance criteria were met.

9. Holding Time

All acceptance criteria were met.

10. Confirmation

None for this SDG.

11. Summary

General Comments 1.) For sample A-0064H-041417-TO-001-LIV, the Internal Standard recovery was high indicating a potential low bias in the sample resullts. Sample was re-analyzed with similar results. Associated detects and non-detects were qualified as estimated and flagged "J" and "UJ" respectively.

Data Package Completeness Package was complete for Tier 2B validation.

Forms Review/ Items of Interest No samples were excluded for dilutions or re-extractions.

COC Review No discrepancies.

Validated Form I

Final Data Flags*

***When the data evaluation process results in multiple flags, the most severe flag becomes the final data flag. All flags are from the site-specific QAPP, except the "exclude" flag that is used to designate results that are not for risk assessment (for example, a result from a dilution where the original undiluted result is appropriate).**

Workorder Information

Workorder: 34-1710499
Client: CH2M

Reporting Manager: Level 4 — Kevin Griffiths
Kevin.Griffiths@ALSGlobal.com x302

Due: 04/28/17
Received: 04/14/17
TAT: 10 work days from receipt

Contract/PO: VA AOU1 700 S. 1600
COC No.: Not Provided
Collector: Not Provided
Airbill: Not Provided

Project: VA AOU1 700 S. 1600 E. 041117
Profile: VA
Format: Report < LOQ
Program: NA

Notes: Level IV Deliverable and CH2MHill/Labspec7 EDD. Indicate sample condition upon receipt. Measure and record the final residual vacuum prior to analysis. NO TICs. Hold Cans for 10 days after reporting. PM must review the report before reporting

Sample Condition at Receipt

Temperature(s)	Expired at Receipt	Notes
NA	NO	Sample(s) received in good condition unless otherwise noted.

2017 Vapor Intrusion Field Work Documentation: AOU-1 East Side Springs, 700 South 1600 East PCE Plume, Salt Lake City, Utah

PREPARED FOR:	Josephine Newton-Lund, PMP, Senior Manager Environmental Branch, U.S. Army Corps of Engineers
COPY TO:	Lynne Welsh, CERCLA Program Manager, Department of Veterans Affairs, Veterans Health Administration
PREPARED BY:	David Waite, CH2M Project Manager Quinten Bingham, CH2M Environmental Engineer
DATE:	May 10, 2017

Introduction

This technical memorandum summarizes the requisite field documentation and additional quality assurance (QA) protocols implemented for the vapor intrusion (VI) sampling conducted between March 6, 2017 and April 14, 2017, at Accelerated Operable Unit 1 (AOU-1) East Side Springs, 700 South 1600 East PCE Plume, Salt Lake City, Utah. Copies of the completed requisite field documentation are provided in Attachments A through G.

2017 Field Quality Assurance Protocols and Documentation Summary

During the 2017 VI investigation of AOU-1, additional QA protocols were implemented from what was required during the 2015 and 2016 AOU-1 VI investigations. The additional QA protocols were implemented to confirm that new sampling data collected in 2017 achieved project data quality objectives. QA protocols included additional field documentation, regulatory and client oversight of field activities, and field documentation. During the first week of the 2017 VI sampling, the U.S. Army Corps of Engineers provided oversight in the field. An in-person meeting was also conducted with the contractor, regulators, and the Veterans Health Administration (VHA) to review 2017 field documentation for accuracy and completeness. In addition, CH2M HILL, Inc. internally reviewed and submitted field documentation to the VHA for routine spot-checking throughout the 2017 sampling event.

A pre-field kick-off meeting occurred with field staff to discuss all field documentation and to discuss the requirements of the quality assurance project plan (QAPP) (FE, 2015) and sampling action plan (SAP) (FE, 2015) as amended by Minor Field Modification (MFM) #18 (EA, 2017). Once field work commenced, the field staff and project manager routinely verified field documentation was performed in accordance with the QAPP, SAP, and MFM #18.

The specific field documentation for Limited VI Protocol (no pressure cycling) sampled locations consisted of:

- **Field Logbook:** The field logbook (Attachment A) contains all field notes specific to each residential sampling event for both the limited protocol, and full protocol sample events. These field notes include HAPSITE® calibration information, time of arrival/departure, brief floor plan sketch with

sampled locations, whether an interior source(s) was identified with the HAPSITE, product manufacturer name and product location, SUMMA deployment time, location, initial/final vacuum, canister/flow controller identification [ID], and sample ID.). The field logbook was a Rite in the Rain® notebook with numbered pages, properly dated and signed by the field representative after each sample event.

- **HAPSITE Field Form:** HAPSITE field forms (Attachment B) were used to log each HAPSITE sample (run number, time, date, location, location description, sample ID, and detected 1,2-dichloroethene, trichloroethene, and tetrachloroethene). One form was dedicated to each sampling event. HAPSITE field forms were spiral bound in booklet form.
- **SUMMA Field Form:** SUMMA field forms (Attachment C) were used to log each SUMMA canister deployment. These forms include sample location, sample ID, canister/flow controller ID, start/end time, start/end date, initial/final vacuums, flow controller flow rate, and a sketch of sample locations. One form was used per sample location. SUMMA field forms were spiral bound in booklet form.
- **VI Investigation QA Assurance Checklist Forms:** VI investigation QA assurance checklist forms (Attachment D) were completed for each sampled location (Full and Limited VI Protocol) to verify that VI sampling was performed in accordance with the QAPP and SAP as amended by MFM #18. These checklists included HAPSITE calibration criteria, field documentation, chain-of-custody (COC) forms, and sampling procedures. Each completed VI investigation QA assurance checklist was reviewed for completeness by an independent reviewer, and signed by that reviewer once it was confirmed the documentation was complete.
- **Daily Report Form:** Daily report forms (Attachment E) were used to log a summary of work performed, health and safety topics, personnel onsite, equipment on hand, and testing/sampling performed. A daily report was completed for each day of sampling. Daily report forms were spiral bound in booklet form.

The field documentation for Full VI Protocol sampled locations consisted of the same documentation for the Limited VI Protocol with the addition of a pressure cycling field form (spiral bound booklet) (Attachment F) where blower flowrates and differential pressures were logged. The SUMMA field form was not necessary for Full VI Protocol sampling because no breathing-zone screening level(s) were exceeded during Full VI Protocol sampling. Therefore, no SUMMA samples were required to be collected from these houses. Soil gas sample results were logged on the HAPSITE field form. Finally, the remaining completed forms (COC forms, analytical request forms, SUMMA canister certifications, and HAPSITE calibration gas documentation) for Limited and/or Full VI Protocol sampling are presented in Attachment G.

Conclusion

The 2017 field quality assurance and documentation for AOU-1 was performed in accordance with the approved QAPP and SAP as amended by MFM #18 (EA, 2017).

0058H

Personel: QGB, RA
Objective: Full protocol VI investigation
Equipment: HAPSITE, Blower door, omniguard IV, AMS Soil Gas kit, Fieldbook
Weather: 30's Partly Cloudy

0600 Arrived @ office. Ran morning CCV (2.5ppbv).
TCE = 2.6ppb/104% RPD PCE = 7.6 ppb/104% RPD CIS = 2.6ppbv/104% RPD
Morning CCV passed

0635 Began loading equipment in vehicle.

0715 MOB to Sunnyside Park for prep field asmt meeting w/ VA and Army Cor.

0755 Arrived @ Sunnyside Park. Filled out and signed PTSP.

0821 Rachel Adams arrived @ Sunnyside Park. Discussed field documentation

0825 Eric Gorman and Ray Weindorf arrived on-site.

0840 Lynn Welsch + Jeremy Laird arrived @ Sunnyside Park.

0850 Tailgate safety meeting. PTSP

0910 Arrive at site - G Bingham, J. Laird, E. Gorman, R. Weindorf, R. Adams. Discuss plan w/ resident. Distribute health and safety plan, pre-task safety form.

0912 prep HAPSITE, fill out VI protocol Sampling checklist.
HAPSITE method = SIM_100PPB_VA_20170305

0925 Collect ambient air sample (front porch)
Sample ID = A-0058H-OA-004-030617-OUT

0934 Collect upstairs air sample - front room between front door and dining area
Sample ID = A-0058H-IA-005-030617-LIV

0940 Resident states sq. footage is just over 1,000 sq ft

0945 Collect basement sample - basement living area
Sample ID = A-0058H-IA-006-030617-BAS

0957 No detects on 1st floor or basement
Set up for pressure cycling, resident leaves

1035 Blower door and omniguard set up (omniguard #G405105)
blower door on basement West door to back yard
omniguard on basement South window

1037 Start taking baseline pressure readings. J. Laird leaves, will return after pressure cycling is complete.

1055 Main stories sq footage (total) is 2450 sq ft
Will collect baseline pressure readings for 30 min (1040-1110)

1115 Start negative pressure cycle
target ΔP = -5

HOU-1

3/6/17

1120 Wind appears to be affecting blower door - pressure readings consistently more negative than omniguard reading. Will use Omniguard reading to set target pressure/ blower flow rate.
Blower flow rate ~ 750 CFM, ~65 min for 2.5 air exchange
Quin collecting HAPSITE samples starting at 1115
Repeat 3 locations: basement between kitchen/ bedroom (1A-007)
basement adjacent to blower door (1A-005)
1st floor dining area (1A-009)
-5 pressure cycle Sample ID start: A-0055H-1A-007-030617-BAS1
Sample ID end: A-0055H-1A-014-030617-STA1

1222 end -5 pressure cycle. increase flow rate for -10 pressure cycle

1225 begin -10 pressure cycle
blower flow rate ~ 1430 CFM
A-ring in fan (-5 pressure cycle: B ring in fan)
~35 minutes for 2.5 air exchange
-10 pressure cycle Sample ID start: A-0055H-1A-015-030617-BAS1
Sample ID end: A-0055H-1A-019-STA1

1300 End -10 pressure cycle

1305 Set up for +5 pressure cycle

1310 begin +5 pressure cycle
blower flow rate ~ 1271 CFM
A-ring in fan
+5 pressure cycle Sample ID start: 1A-020-030617-BAS1
~~1350~~ RA Sample ID end: 1A-024-030617-STA1

1350 End +5 pressure cycle
break down blower door, omni guard
Quin leaves to set up soil gas sampling

1420 ~~soil~~ RA Collect soil gas sample (S side by basement window)
depth = ~~5' BGS~~ RA 48" BGS (4' below slab)
Diluted 1:10
Sample ID = A-0055H-SG-025-030617-04'

1430 Run SG-025-030617-04'. Results all non-detect.

1440 run undiluted sample
Sample ID = SG-026-030617-04'
Results all non-detect.

1452 Run undiluted sample collected @ 71.5" bgs (collected at 1430 by Q. Bingham)
Sample ID = SG-027-030617-06'

6 Results all non-detect.

AGU-1 QB 5/4/17 3/6/17 4/4

~~AGU-1 Groundwater Profile~~

OU 58-H PN 683085.SC.08.01

1500 Q. Bingham breaks down soil gas sampling equipment.

1502 Run blank on HAPSITE (run # 28)

1510 Pack up equipment

1520 leave residence, discuss documentation w/ R. Weindorf
will meet at residence tomorrow ~10 min before appt

1530 - Survey mode not utilized as no indoor concentrations observed
- Floor drain in basement kitchen covered by linoleum, not an entry point
- Floor crack (small) in mechanical room, did not appear to be an entry point
- Only 2 soil gas samples collected due to both samples returning non-detect results

1535 MOB to SLC office. Rachel Adams MOB home.

1605 Arrived @ SLC office. For end of day CCV (5ppbv std)
TCE + PCE passed calibration checks (82% RPD for both)
Cis failed (RPD = 56%). Feedback 3/7/17 to improve Cis response

RCA RPD 3/6/17

Rite in the Rain

ACM-1
00601H
~~PW664016.01.TI~~ PW 683085.SC.08.01 @3 5/4/17 3/7/17

Personnel: QG3, RA
Objective: Full VI protocol investigation @ 00601H.
Equipment: HAPSITE, Blower door, Omniguard, AWS soil gas kit, field tools
Weather: Partly cloudy, 30°F

0600 Arrived @ the office to recalibrate the HAPSITE since CIS RPD was 50% @ the end of the day 3/6/17.
0630 Emailed 03/06/17 scanned field documentation to team.
0745 Calibration completed all analytes ~~passed~~ met @ 3/1107, the calibration quality verification run for calibration check w/ 2.5 ppbv. Calibration check Passed. RPDs for CIS, TCE, PCE were 96%, 108%, and 104%, respectively.
0800 left office for site
0845 Met w/ Roy Weindorf, Eric Gorman, Rolf Lange (VA), Joelle Dickson (SAGE). Distribute pre-task safety plan. Discuss plan for sampling.
0900 Enter residence, discuss sampling with resident. Prepare HAPSITE for sampling. Review documentation.
0906 Collect ambient air sample (front porch)
0916 Collect 1st floor sample (entryway)
0925 Collect 2nd floor sample (hallway)
0933 Collect basement sample (family room)
0940 Collect 2nd basement sample (laundry / water heater room)
0948 Results all non-detect - will not sample in survey mode as no indoor sources are indicated.
0950 Collect 3rd basement basement sample (storage room)
Minor crack noted in concrete in water heater room
paint cans stored in water heater room
1000 No HAPSITE surveys were conducted since all quantitative samples were non-detect for CIS, TCE, PCE.
1005 Set up blower door. Omniguard IV installed in basement living room. Set to log differential pressure every 5 minutes.
1020 begin collecting baseline pressures.
Quin notes Omniguard should be moved so it is not set up on the same wall as the blower door.
Move Omniguard to East bedroom window.
1030 ~~1025~~ RA Re-start baseline pressure readings
Noted floor drain in laundry room
1035 Quin turns off gas line to boiler / water heater
1045 Quin calculates sq. footage to be ~4400 sq ft.
Ceilings are ~7 ft (basement) to 9-10 ft (1-2 floors)
Will use 9 ft for ceiling height.

3/8/17

Personnel: QB, RA
Objective: Full-st sampling of 0061-H.
Equipment: HAPSITE, Blower door, Ams soil gas kit, field tools
Weather: 40°F Cloudy

0700 Arrived @ office. Ran 5 ppbv CCV. All analytes passed. CIS = 4.1 ppbv / 82% RPD, TCE = 4.5 ppbv / 90% RPD, PCE = 4.1 ppbv / 82% RPD

0830 mob to 0061H.

0905 Arrived @ 0061H. Began HAPSITE survey/investigation. Completed PTSP. Everyone signed it. Lawrence QB 3/8/17
Personnel on-site = Quin Bingham, Rachel Adams, Lawrence Kellam, Roy Wendorf, David Allison.

0915 Collected outdoor air sample.

0925 Collected main level indoor air sample.

0934 Collected basement indoor air. Basement is larger crawlspace w/ 5-foot ceiling. Basement is not livable space

0955 Collect upstairs bedroom indoor air.

1005 Collect main level kitchen indoor air

1025 No interior sources identified, survey mode not run

1030 2 potential entry paths observed in basement: crack near stairs / door, sunken foundation (sunken ~ 1 ft, bottom covered w/ concrete, sides not covered / dirt.)
- Set up omniguard, blower door. Set blower door in laundry room as dining area is an addition to the house (constructed in ~1960s)

1050 begin collecting baseline pressure readings

1056 Run mid-day cal check

1100 Quin states main floor is 1368 sq ft / 10 ft ceiling
upstairs is 528 sq ft / 8 ft ceiling
basement is 869 sq ft / 5 ft ceiling
- sq footage from county assessor
- Volume (calculated) = 22,349 cu. ft.

1120 End baseline pressure readings. Quin reviews sample results prior to starting -5 pressure step.

1135 begin -5 pressure step
Running in fan, flow rate ~ 1507 CFM
Quin rotates sample locations: 1A-0032 (living room) LIV1
1A-0034 (basement) BAS1
1A-0035 (2nd floor bedroom) BED1
1A-0037 (kitchen) KIT1

0013H, 0027H, 0026H Limited Protocol / HE Sampling

PN 693095. SL. 08.02

3/9/17

Personnel: QGB

Objective: Limited HE Protocol sampling @ 0026H, 0027H, and 0013H.

Equipment: HAPSITE, SUMMA canisters, field tools

Weather: Sunny 40°F

0730 Arrived @ SLC office. Ran 5 ppbv CCV. CIS = 4.0 ppbv / 8% RPD
TCE = 4.5 ppb / 90% RPD, PCE = 4.2 ppb / 8% RPD

0800 Printed questionnaires. Review SAP sample naming convention

0830 MOB to 0026H.

0900 Arrived @ 0026H. Introduced the team to resident. On-site: Dan Bingham, Jeremy Laird, Roy Wendorf, Laura Goldner. Flow down in Laundry room

0910 Began HAPSITE survey of 0026H.

0915 007-BAS1 basement Living Room 0.19 ppbv PCE

0925 008-LAU1 basement Laundry Room 0.16 ppbv PCE

~~0930~~ HAPSITE field log for other HAPSITE results.
Sampled all structure levels in quant mode. PCE was ubiquitous throughout structure @ 0.13 - 0.19 ppbv

1015 Ran survey mode to sniff products in basement utility room. No products containing PCE were identified. [PCE-3TON-SURVEY Run #001]

1035 Deployed 6-L SUMMA canister in basement pantry.

Canister ID: 0366 Flow Controller: 0155

Initial P: -25.01 inHg Final P: 0.05 inHg

Start time: 1040 End time: 925

Start Date: 3/9/17 End Date: 3/10/17

Sample ID: A-0026H-031017-TO-002-BAS

Previous 2015 sample location was in the basement pantry, which is not a livable space. Canister placed in this location to replicate 2015 results. Preferred canister placement would be in basement living room.

1050 Left 0026H. MOB to 0027H.

1100 Arrived @ 0027H. Resident signed access agreement. Set up to begin HAPSITE quantitative sampling.

1105 Collected outdoor air sample on north side of structure.

1114 Collected sample in main level Living room (Rm # 013)

1123 Sampled basement level in two locations. Basement hallway between Laundry room and had remained the mechanical room w/ furnace and stamps. Mechanical room has large cracks in mechanical room concrete floor where old boiler used to be located. All levels of structures were sampled (2 levels). No target analytes were detected.

3/13/17

Personel: OGB
Objective: Limited VI protocol sampling of 0025H, 0004H, 0012H
Equipment: HAPSITE, SUMMA, field tools
Weather 45°, Partly Cloudy
0630 Arrived @ SLC office. Obtained last weeks field documents.
0705 Ran 5 ppbv CCV. All analytes passed. CIS: 4.5 ppbv / 90% RPD, TCE: 4.8 ppbv / 96% RPD, PCE: 4.7 ppbv / 94% RPD. Updated / Uploaded field documents to SharePoint site.
0830 MOB to 0025H.
0900 Arrived @ 0025H. Nic Kirkham & Laurie Goldner on site
0905 Resident signed access agreement. 3/13/17
0905 Collected outdoor air sample [Run # 003]. 68 ND.
0914 Collected indoor air sample in main level living room [Run # 003]. CIS - 12 - DCE = 0.18 ppbv. Will check to see if it was actually CIS - 12 - DCE. Detector was a false positive. 3/13/17
0923 Collected indoor air sample in basement hallway. Central location. No target analytes were detected in indoor air and outdoor air @ 0025H
0938 Set up to deploy 24-hr 6-L Summa canister. Deployed in basement hallway
SAMPLE ID = A-0025H-031017-TO-001-BAS
Canister ID = 0475 FLOW CONTROLLER ID: 0651
INITIAL PE = -25.14 in Hg FINAL PE = -1.00 " Hg
Start Date: 3/13/17 End date: 3/14/17
Start time: 1008 End time: 0910
1030 Left 0025H. Left return appointment for 3/14/17 @ 0900
1057 Arrived @ 0004H. Nic Kirkham and Laurie Goldner on site. Resident signed access agreements. Met Nic & Laurie Sup PTSP. Structure is a two-story duplex (basement/ground level)
1115 Collected outdoor air sample [Run #006] northside of east apt.
1125 Collected indoor air sample in main level living room [Run # 007].
1139 Collected indoor air sample in basement level [Run # 008]. Basement is ove Laggo room.
1148 No target analytes detected in indoor air or outdoor air.
1150 Set up to deploy Summa canister in basement area.

LIMITED VI PROTOCOL SAMPLING

PN. 685085.SL.06.02

3/15/17

Personel: QGB

Objective: Limited VI protocol sampling of 0001H and Summa canister deployment @ 0026H.

Weather: ~50°F Sunny

Equipment: HAPSITE, Summa Canisters, Field tools

0819 Ran beginning of day 5 ppb CCV. All analytes passed CIS= 4.9 ppbv/96% RPD, TCE= 4.7 ppbv/7% RPD, PCE= 4.6 ppbv/92% RPD.

0830 MWD to 0001H.

0855 Arrived @ 0001H. Elizabeth Wessling (3rd party oversight) and Larry Kellum (VE/Arcadis) on site. All signed PTSP.

1000 Residents allowed entrance and signed access agreement.

1005 Analyzed outdoor air sample [Run # 003]. All non-detect.

1112 Analyzed Main level living room indoor air [Run # 004]. PCE = 0.73 ppbv. CIS + TCE = non-detect

1127 Analyzed basement living area indoor air [Run # 005]. Basement living area is one large area with a few closets and a mechanical Room PCE = 0.33 ppbv. CIS + TCE were non-detect.

1138 Analyzed basement sump room indoor air [Run #006]. PCE = 0.34 ppbv. CIS+TCE were non-detect. Water seeping in basement sump room (damp foundation wall) not a lot of water.

1152 Analyzed basement bedroom indoor air [Run #007]. PCE = 0.25 ppbv. CIS + TCE both non-detect.

1207 Analyzed upstairs west bedroom indoor air (window was cracked open 4-inches) [Run # 008]. PCE = 0.36 ppbv. CIS + TCE were non-detect.

1218 Analyzed master bedroom (east) indoor air [Run # 009]. PCE = 0.76 ppbv CIS + TCE were non-detect.

1227 Ran scan method to help determine background for Run 01.

1236 Analyzed upstairs bathroom indoor air [Run # 010]. PCE=

1245 Sniffed chemicals stored under kitchen sink.

BCIS-3 Room-Survey Runs 001 + 002

Goo Gone found to contain PCE. Requested that the resident remove Goo Gone from residence. Resident agreed and plans to store it outside / detached garage. No canister was deployed. Canister sample rescheduled for 3/22/17 @ 1100 am.

29 1315 Left residences.

3/17/17

Full VE Protocol

PN 083085.SL.08.02

Personel: QGB, RA

Objective: Full VE protocol sampling of 0059H.

Weather: Sunny 60°F

Equipment: HAPSITE, 1 Tedlar Soil Gas kit, blower door, omniguard IV, field tools

0530 Arrived @ SEC office. Loaded equipment in vehicle. Received TO-15 COC + AFF.

0600 Began HAPSITE calibration.

0830 QGB Finish calibration

0845 Leave for site

0900 Quin Bingham, Rachel Adams, Rolf Lange (VA), Liz Wessling (MEC*) meet at residence. Tailgate safety topics = slips trips and falls. Discuss sampling.

0905 Enter residence, discuss sampling with resident. Fill out daily, PISP, review documentation.

0910 Ambient outdoor air sample collected (OUT 1)

0922 QA 3/17/17 ~~Upstairs~~ hallway sample collected (HAL 1)

0928 Upstairs landing area sample collected (LAN 1)

0937 basement landing sample collected (BAS 1)

0948 All results non detect, no indoor sources identified. Prepare for pressure cycling

0950 Minor cracks noted in laundry room / boiler room, floor drain (concrete floor), basement storage room
No signs of seepage

1000 basement storage room in laundry / boiler area - 3 ft x 3 ft piece of concrete slab missing, water line enters at this location.
Quin photographs missing slab, cracks

1005 3100 sq. ft - resident estimate for square feet.
Resident turned off gas to boiler, states he will restart after sampling is complete. Resident states landscaping crew may need to enter home periodically.

1010 Set up blower door, omniguard

1020 begin baseline pressure readings

1040 Discuss sampling locations w/ Quin. Will rotate 4 locations:
blower door
laundry room door
main floor landing
Upstairs hallway

1045 Collect sample from basement storage area, results non-detect (STO 1)

1050 End baseline pressure, begin set up for -5 pressure step

1100 Start -5 pressure step, A-ring in fan
Flow rate ~ ~~390 CFM~~ RM 3/17/17 1220 CFM
blower door trending more negative than omni guard, will use omni as set point
Volume calculated = 24800 ft³
Time calculated for 2.5 air exchange ≈ 50 min

1105 Quin discussed leaving the house w/ landscaping crew (leave quickly w/out leaving doors open)

1110 0.35 ppbv PCE detection in basement laundry room (run # 020), storage room nondetect

1120 Resident notes cleaning supplies are stored in laundry room, Quin will run survey mode to determine if indoor air sources are present.

1125 Quin begins survey mode, method = PCE 3 ion survey
Detect on Goo Gone (time 2:45) (removed to backyard)

1132 End survey mode

1136 Quin runs survey mode on additional products, no detects

1138 End survey mode, begin collecting samples

1155 Finish 2.5 air exchange, continue -5 pressure cycle until samples are collected

1204 0.18 ppbv PCE detection in basement laundry room (run # 25)

1234 Run survey mode on additional product, non detect

1235 End -5 pressure step, begin -10 pressure step
A-ring in fan, flow rate ~ 1965 cfm
Time calculated = 30 minutes

3/17/17

Rite in the Rain

0059 H
Full VI protocol
683085.9L.05.02

5/19/17

1235 Quin notes a discernible sewer smell coming from floor drain in laundry room after beginning -10 step

1240 Quin discusses floor drain w/ resident, resident uses hose in laundry room to rinse drain / flush odor
- Quin collects floor drain sample (LAU2) (collected at 1230)
PCE = 158 ppbv
TCE = 2.3 ppbv
Cis = 0.551 ppbv
Probe placed @ floor drain

1250 Collected laundry room indoor air sample after filling floor drain w/ water. [Run #030]
PCE = 0.47 ppbv
TCE = <0.1
CVS = <0.1

1258 Notable sewer odor coming from basement laundry room floor drain after adding water. ~~tester~~ Standing water is visible in drain now that it was filled. Standing water was not visible during sample run #029.

1303 Collected another laundry room sample (floor drain room) to see what PCE concentrations are doing. Run # 032. PCE = 0.14 ppbv PCE concentrations have decreased from 0.47 ppbv immediately ~~flowing~~ 200 ml/min following filling floor drain w/ water.

1317 Collect sample above floor drain after it was filled w/ water (floor drain located in laundry room [basement]). Concentrations of target analyte decrease w/ addition of water CIS = <0.1 ppbv
TCE = 0.39 ppbv
PCE = 32.49 ppbv

1323 Ended -10 pascal pressure cycle step.

1333 Began +5 pascal pressure cycle step
↳ ~~Burning~~ on 3/17/17 in fan, flow rate ~1560 CFM
A-ring
Estimated time = 40 minutes

1400 Quin discussed Goo Gone / Indoor air source w/ resident, requested removal

1430 Quin emailed indoor air results to PM/VIA
End 5 pressure step (1423), break down blower door, prepare soil gas sampling

CA01H, CA02H 3/22/17
Limited Vet Patrol
PN 6850BS.SL.08.02

Personnel: QGB
Equipment: HAPSITE, Summa canisters
Objective: Limited Vet protocol sampling of CA01H & CA02H.
Weather: Cloudy ~50°F
0900 Began HAPSITE recalibration since 3/21/17 5 ppbv CCV. CIS % difference was 66%.
Method: Sim-100HAPSITE-VA-20170322
Calibration Range: 0.1 – 10 ppbv
1040 Ran 5 ppbv CCV. All analytes passed.

1045 MOB to CA01H.
1110 Arrived @ CA01H. Resident was allowed access.
1115 Collected IA sample in Living Room (ground level). [Run # 010]
PCE = 0.29 ppbv. CIS false positive. Attributed to air fresheners.
1125 Collected OA sample west side of structure [Run # 011]. All target analytes were non-detect. No target analytes detected on OA.
1134 Collected IA sample in basement living area [Run # 012].
PCE = 0.20 ppbv. CIS + TCE not detected.
1152 Deployed two 6L Summa canisters equipped w/ 200 mL/m flow controllers. One is a field duplicate.

Normal

Order No: Task Order 5

DATE: 3/15/16

PERSONNEL PRESENT:

Name	Position	Company/Government
Dan Bingham	Env. Eng.	CH2M
Elizabeth Wessling	3rd Party Oversight	MECX
Larry Kellum	Public Relations	HH

LOCATION/RESIDENCE: OOOIH

Circle correct response for all items:

PROTOCOL: LIMITED FULL

PRE-FIELD/LAB SUPPLIES

YES or NO or NA: Individually certified-clean SUMMA canister(s) and flow controller(s) on-hand (if needed)?

HAPSITE CALIBRATION

YES or NO: HAPSITE was calibrated by KD Analytical-trained personnel prior to initiation of sampling event?

YES or NO: Five-point HAPSITE calibration met quality assurance criteria for all target analytes (cis-DCE, TCE, PCE) and was recorded on the HAPSITE field form (relative standard deviation (RSD) < 20%, RSD of response factor < 30%, and curve fit R-squared ≥ 0.98)?

YES or NO: If HAPSITE not calibrated on date of form completion, was a calibration verification sample analyzed using a known concentration calibration gas and was the relative percent difference (RPD) for all target analytes ≥ 70% or ≤ 130 %.

YES or NO: Was continuing calibration verification standard run at end of the daily sampling event?

FIELD DOCUMENTATION

YES or NO: All required field documentation on-site (field log book, HAPSITE Field Form, Pressure Cycling Field Form, SUMMA Field Form, Analytical Laboratory Chain of Custody [COC], Minor Field Modification #18)?

LIMITED VI PROTOCOL SAMPLING CHECKLIST

1. **YES or NO:** Signed access agreement has been obtained?
2. **YES or NO:** Reviewed completed residential questionnaire?
3. **YES or NO:** HAPSITE was operated by KD Analytical-trained personnel?
4. **YES or NO:** All levels of structure have had at least one indoor air sample analyzed with the HAPSITE?
5. **YES or NO:** If interior background source(s) was identified, was its location and product name recorded in the field log book? Geo Grade
6. **YES or NO or NA:** If interior background source(s) was identified, was the structure owner informed of the product and was its removal requested and granted? resident agreed to place in backyard
7. **YES or NO or NA:** If interior background source(s) was identified, was a future appointment to deploy a 24-hr SUMMA canister scheduled no sooner than 72 hours after HAPSITE identification and removal of the interior background source? Returned 3/31/17 3/29/17 @ 11AM
8. **YES or NO:** Were any vapor intrusion entry points identified within the structure? If so, was the location(s) recorded in the field log book along with a description? Although there is a sump and floor drain in basement.
9. **YES or NO or NA:** If no interior background source(s) was identified, was a 24-hr SUMMA canister deployed in the lowest livable space within the structure?
10. **YES or NO or NA:** Was the deployment location, date/time, initial pressure, canister/flow controller identification number, sample identification number recorded on the SUMMA field form?
11. **YES or NO or NA:** Do completed SUMMA tags match information recorded on the SUMMA field form and COC?
12. **YES or NO or NA:** Was a canister retrieval appointment scheduled (< 23 hours from canister deployment time)?
13. **YES or NO:** Was a SUMMA field duplicate required? If so, was it deployed? NA
14. **YES or NO:** Was the correct sample identification assigned to the SUMMA sample(s)? NA

15. **YES or NO:** Was all applicable field documentation completed?

16. **YES or NO:** Were adequate field notes taken during the sampling event?

17. **YES or NO:** Were corrections to field notes necessary? If so, were corrections completed correctly (i.e., single-line through the error, initialed, and dated)?

18. **YES or NO:** Were the HAPSITE and SUMMA Field Forms completed properly?
    QA 1/19/17

19. **YES or NO:** Was the laboratory COC completed properly?

FULL VI PROTOCOL SAMPLING CHECKLIST

1. **YES or NO:** Signed access agreement has been obtained?
2. **YES or NO:** Reviewed completed residential questionnaire?
3. **YES or NO:** Were all underground utilities marked by Blue Stake and/or 3rd Party Utility locate?
4. **YES or NO:** HAPSITE was operated by KD Analytical-trained personnel?
5. **YES or NO:** All levels of structure have had at least one indoor air sampled analyzed with the HAPSITE?
6. **YES or NO:** If interior background source(s) was identified, was its location and product name recorded in the field log book?
7. **YES or NO or NA:** If interior background source(s) was identified, was the structure owner informed of the product and was its removal requested and granted?
8. **YES or NO:** Was the structure's air volume calculated?
9. **YES or NO:** Were all combustible appliances turned off prior to beginning pressure cycling?
10. **YES or NO:** Were all target differential pressures achieved during pressure cycling (both negative and positive)?
11. **YES or NO:** Were 2.5 air volume exchanges achieved during pressure cycling (both negative and positive)?
12. **YES or NO:** Were any vapor intrusion entry points identified within the structure? If so, was the location(s) recorded in the field log book along with a description?
13. **YES or NO:** Was the required soil gas sample collected at approximately 6-inches below the basement slab grade?
14. **YES or NO:** Were any indoor air RALs exceeded? If so, were the Project Manager and VA informed of the exceedance?
15. **YES or NO:** Were any indoor air RSLs exceeded? If so, were the Project Manager and VA informed of the exceedance?
16. **YES or NO:** If an indoor air RSL was exceeded, was a future appointment scheduled to deploy a 24-hr SUMMA canister and collect a soil gas sample for TO-15 analysis?
17. **YES or NO or NA:** Was the deployment location, date/time, initial pressure, canister/flow controller identification number, sample identification number recorded on the SUMMA field form?

18. **YES or NO or NA:** Do completed SUMMA tags match information recorded on the SUMMA field form and COC?

19. **YES or NO or NA:** Was a canister retrieval appointment scheduled (< 23 hours from canister deployment time)?

20. **YES or NO:** Was a SUMMA field duplicate required? If so, was it deployed?

21. **YES or NO:** Was the correct sample identification assigned to the SUMMA sample(s)?

22. **YES or NO:** Was all applicable field documentation completed?

23. **YES or NO:** Were adequate field notes taken during the sampling event?

24. **YES or NO:** Were corrections to field notes necessary? If so, were corrections completed correctly (i.e., single-line through the error, initialed, and dated)?

25. **YES or NO:** Were the HAPSITE and SUMMA Field Forms completed properly?

26. **YES or NO:** Was the laboratory COC completed properly?

I, Owen Bingham, certify that this quality assurance checklist was reviewed and completed and that all field forms herein referenced were completed and reviewed at the end of the sampling event conducted on 3/15/17.

4. **YES or NO:** HAPSITE was operated by KD Analytical-trained personnel?
5. **YES or NO:** All levels of structure have had at least one indoor air sampled analyzed with the HAPSITE?
6. **YES or NO:** If interior background source(s) was identified, was its location and product name recorded in the field log book?
7. **YES or NO or NA:** If interior background source(s) was identified, was the structure owner informed of the product and was its removal requested and granted?
8. **YES or NO:** Was the structure's air volume calculated?
9. **YES or NO:** Were all combustible appliances turned off prior to beginning pressure cycling?
10. **YES or NO:** Were all target differential pressures achieved during pressure cycling (both negative and positive)?
11. **YES or NO:** Were 2.5 air volume exchanges achieved during pressure cycling (both negative and positive)?
12. **YES or NO:** Were any vapor intrusion entry points identified within the structure? If so, was the location(s) recorded in the field log book along with a description?
13. **YES or NO:** Was the required soil gas sample collected at approximately 6-inches below the basement slab grade?
14. **YES or NO:** Were any indoor air RALs exceeded? If so, were the Project Manager and VA informed of the exceedance?
15. **YES or NO:** Were any indoor air RSLs exceeded? If so, were the Project Manager and VA informed of the exceedance?
16. **YES or NO:** If an indoor air RSL was exceeded, was a future appointment scheduled to deploy a 24-hr SUMMA canister and collect a soil gas sample for TO-15 analysis?
17. **YES or NO or NA:** Was the deployment location, date/time, initial pressure, canister/flow controller identification number, sample identification number recorded on the SUMMA field form?

18. **YES or NO or NA:** Do completed SUMMA tags match information recorded on the SUMMA field form and COC?

19. **YES or NO or NA:** Was a canister retrieval appointment scheduled (< 23 hours from canister deployment time)?

20. **YES or NO:** Was a SUMMA field duplicate required? If so, was it deployed?

21. **YES or NO:** Was the correct sample identification assigned to the SUMMA sample(s)?

22. **YES or NO:** Was all applicable field documentation completed?

23. **YES or NO:** Were adequate field notes taken during the sampling event?

24. **YES or NO:** Were corrections to field notes necessary? If so, were corrections completed correctly (i.e., single-line through the error, initialed, and dated)?

25. **YES or NO:** Were the HAPSITE and SUMMA Field Forms completed properly?

26. **YES or NO:** Was the laboratory COC completed properly?

I, Dan Bingham, certify that this quality assurance checklist was reviewed and completed and that all field forms herein referenced were completed and reviewed at the end of the sampling event conducted on 3/22 - 3/23/17.

Circle correct response for all items:

PROTOCOL: LIMITED **FULL**

PRE-FIELD/LAB SUPPLIES

YES or NO or NA: Individually certified-clean SUMMA canister(s) and flow controller(s) on-hand (if needed)?

HAPSITE CALIBRATION

YES or NO: HAPSITE was calibrated by KD Analytical-trained personnel prior to initiation of sampling event?

YES or NO: Five-point HAPSITE calibration met quality assurance criteria for all target analytes (cis-DCE, TCE, PCE) and was recorded on the HAPSITE field form (relative standard deviation (RSD) < 20%, RSD of response factor < 30%, and curve fit R-squared ≥ 0.98)?

YES or NO: If HAPSITE not calibrated on date of form completion, was a calibration verification sample analyzed using a known concentration calibration gas and was the relative percent difference (RPD) for all target analytes ≥ 70% or ≤ 130 %.

YES or NO: Was continuing calibration verification standard run at end of the daily sampling event?

FIELD DOCUMENTATION

YES or NO: All required field documentation on-site (field log book, HAPSITE Field Form, Pressure Cycling Field Form, SUMMA Field Form, Analytical Laboratory Chain of Custody [COC], Minor Field Modification #18)?

LIMITED VI PROTOCOL SAMPLING CHECKLIST

1. **YES or NO:** Signed access agreement has been obtained?
2. **YES or NO:** Reviewed completed residential questionnaire?
3. **YES or NO:** HAPSITE was operated by KD Analytical-trained personnel?
4. **YES or NO:** All levels of structure have had at least one indoor air sample analyzed with the HAPSITE?
5. **YES or NO:** If interior background source(s) was identified, was its location and product name recorded in the field log book? (NA)
6. **YES or NO or NA:** If interior background source(s) was identified, was the structure owner informed of the product and was its removal requested and granted?
7. **YES or NO or NA:** If interior background source(s) was identified, was a future appointment to deploy a 24-hr SUMMA canister scheduled no sooner than 72 hours after HAPSITE identification and removal of the interior background source?
8. **YES or NO:** Were any vapor intrusion entry points identified within the structure? If so, was the location(s) recorded in the field log book along with a description?
   Note: old floor drain in water heater closet but indoor air was all ND.
9. **YES or NO or NA:** If no interior background source(s) was identified, was a 24-hr SUMMA canister deployed in the lowest livable space within the structure?
10. **YES or NO or NA:** Was the deployment location, date/time, initial pressure, canister/flow controller identification number, sample identification number recorded on the SUMMA field form?
11. **YES or NO or NA:** Do completed SUMMA tags match information recorded on the SUMMA field form and COC?
12. **YES or NO or NA:** Was a canister retrieval appointment scheduled (< 23 hours from canister deployment time)?
13. **YES or NO:** Was a SUMMA field duplicate required? If so, was it deployed?
14. **YES or NO:** Was the correct sample identification assigned to the SUMMA sample(s)?

15. **YES or NO:** Was all applicable field documentation completed?

16. **YES or NO:** Were adequate field notes taken during the sampling event?

17. **YES or NO:** Were corrections to field notes necessary? If so, were corrections completed correctly (i.e., single-line through the error, initialed, and dated)?

18. **YES or NO:** Were the HAPSITE and SUMMA Field Forms completed properly?

19. **YES or NO:** Was the laboratory COC completed properly?
Will be completed in office

FULL VI PROTOCOL SAMPLING CHECKLIST

1. **YES or NO:** Signed access agreement has been obtained?
2. **YES or NO:** Reviewed completed residential questionnaire?
3. **YES or NO:** Were all underground utilities marked by Blue Stake and/or 3rd Party Utility locate?
4. **YES or NO:** HAPSITE was operated by KD Analytical-trained personnel?
5. **YES or NO:** All levels of structure have had at least one indoor air sampled analyzed with the HAPSITE?
6. **YES or NO:** If interior background source(s) was identified, was its location and product name recorded in the field log book?
7. **YES or NO or NA:** If interior background source(s) was identified, was the structure owner informed of the product and was its removal requested and granted?
8. **YES or NO:** Was the structure's air volume calculated?
9. **YES or NO:** Were all combustible appliances turned off prior to beginning pressure cycling?
10. **YES or NO:** Were all target differential pressures achieved during pressure cycling (both negative and positive)?
11. **YES or NO:** Were 2.5 air volume exchanges achieved during pressure cycling (both negative and positive)?
12. **YES or NO:** Were any vapor intrusion entry points identified within the structure? If so, was the location(s) recorded in the field log book along with a description?
13. **YES or NO:** Was the required soil gas sample collected at approximately 6-inches below the basement slab grade?
14. **YES or NO:** Were any indoor air RALs exceeded? If so, were the Project Manager and VA informed of the exceedance?
15. **YES or NO:** Were any indoor air RSLs exceeded? If so, were the Project Manager and VA informed of the exceedance?
16. **YES or NO:** If an indoor air RSL was exceeded, was a future appointment scheduled to deploy a 24-hr SUMMA canister and collect a soil gas sample for TO-15 analysis?
17. **YES or NO or NA:** Was the deployment location, date/time, initial pressure, canister/flow controller identification number, sample identification number recorded on the SUMMA field form?

18. **YES or NO or NA:** Do completed SUMMA tags match information recorded on the SUMMA field form and COC?

19. **YES or NO or NA:** Was a canister retrieval appointment scheduled (< 23 hours from canister deployment time)?

20. **YES or NO:** Was a SUMMA field duplicate required? If so, was it deployed?

21. **YES or NO:** Was the correct sample identification assigned to the SUMMA sample(s)?

22. **YES or NO:** Was all applicable field documentation completed?

23. **YES or NO:** Were adequate field notes taken during the sampling event?

24. **YES or NO:** Were corrections to field notes necessary? If so, were corrections completed correctly (i.e., single-line through the error, initialed, and dated)?

25. **YES or NO:** Were the HAPSITE and SUMMA Field Forms completed properly?

26. **YES or NO:** Was the laboratory COC completed properly?

I, Quin Bingham, certify that this quality assurance checklist was reviewed and completed and that all field forms herein referenced were completed and reviewed at the end of the sampling event conducted on 3/14/17.

HAPSITE CALIBRATION

YES or NO: HAPSITE was calibrated by KD Analytical-trained personnel prior to initiation of sampling event?

YES or NO: Five-point HAPSITE calibration met quality assurance criteria for all target analytes (cis-DCE, TCE, PCE) and was recorded on the HAPSITE field form (relative standard deviation (RSD) < 20%, RSD of response factor < 30%, and curve fit R-squared ≥ 0.98)?

YES or NO: If HAPSITE not calibrated on date of form completion, was a calibration verification sample analyzed using a known concentration calibration gas and was the relative percent difference (RPD) for all target analytes ≥ 70% or ≤ 130 %.

YES or NO: Was continuing calibration verification standard run at end of the daily sampling event?

FIELD DOCUMENTATION

YES or NO: All required field documentation on-site (field log book, HAPSITE Field Form, Pressure Cycling Field Form, SUMMA Field Form, Analytical Laboratory Chain of Custody [COC], Minor Field Modification #18)?

LIMITED VI PROTOCOL SAMPLING CHECKLIST

1. **YES or NO:** Signed access agreement has been obtained?
2. **YES or NO:** Reviewed completed residential questionnaire?
3. **YES or NO:** HAPSITE was operated by KD Analytical-trained personnel?
4. **YES or NO:** All levels of structure have had at least one indoor air sample analyzed with the HAPSITE?
5. **YES or NO:** If interior background source(s) was identified, was its location and product name recorded in the field log book? NA
6. **YES or NO or NA:** If interior background source(s) was identified, was the structure owner informed of the product and was its removal requested and granted?
7. **YES or NO or NA:** If interior background source(s) was identified, was a future appointment to deploy a 24-hr SUMMA canister scheduled no sooner than 72 hours after HAPSITE identification and removal of the interior background source?
8. **YES or NO:** Were any vapor intrusion entry points identified within the structure? If so, was the location(s) recorded in the field log book along with a description?
9. **YES or NO or NA:** If no interior background source(s) was identified, was a 24-hr SUMMA canister deployed in the lowest livable space within the structure? Basement Canister Form
10. **YES or NO or NA:** Was the deployment location, date/time, initial pressure, canister/flow controller identification number, sample identification number recorded on the SUMMA field form?
11. **YES or NO or NA:** Do completed SUMMA tags match information recorded on the SUMMA field form and COC?
12. **YES or NO or NA:** Was a canister retrieval appointment scheduled (< 23 hours from canister deployment time)? Due to residents schedule, canister was retrieved after 22 hours.
13. **YES or NO:** Was a SUMMA field duplicate required? If so, was it deployed?
14. **YES or NO:** Was the correct sample identification assigned to the SUMMA sample(s)?

15. **YES or NO:** Was all applicable field documentation completed?

16. **YES or NO:** Were adequate field notes taken during the sampling event?

17. **YES or NO:** Were corrections to field notes necessary? If so, were corrections completed correctly (i.e., single-line through the error, initialed, and dated)?

18. **YES or NO:** Were the HAPSITE and SUMMA Field Forms completed properly?

19. **YES or NO:** Was the laboratory COC completed properly?

FULL VI PROTOCOL SAMPLING CHECKLIST

1. **YES or NO:** Signed access agreement has been obtained?
2. **YES or NO:** Reviewed completed residential questionnaire?
3. **YES or NO:** Were all underground utilities marked by Blue Stake and/or 3rd Party Utility locate?
4. **YES or NO:** HAPSITE was operated by KD Analytical-trained personnel?
5. **YES or NO:** All levels of structure have had at least one indoor air sampled analyzed with the HAPSITE?
6. **YES or NO:** If interior background source(s) was identified, was its location and product name recorded in the field log book?
7. **YES or NO or NA:** If interior background source(s) was identified, was the structure owner informed of the product and was its removal requested and granted?
8. **YES or NO:** Was the structure's air volume calculated?
9. **YES or NO:** Were all combustible appliances turned off prior to beginning pressure cycling?
10. **YES or NO:** Were all target differential pressures achieved during pressure cycling (both negative and positive)?
11. **YES or NO:** Were 2.5 air volume exchanges achieved during pressure cycling (both negative and positive)?
12. **YES or NO:** Were any vapor intrusion entry points identified within the structure? If so, was the location(s) recorded in the field log book along with a description?
13. **YES or NO:** Was the required soil gas sample collected at approximately 6-inches below the basement slab grade?
14. **YES or NO:** Were any indoor air RALs exceeded? If so, were the Project Manager and VA informed of the exceedance?
15. **YES or NO:** Were any indoor air RSLs exceeded? If so, were the Project Manager and VA informed of the exceedance?
16. **YES or NO:** If an indoor air RSL was exceeded, was a future appointment scheduled to deploy a 24-hr SUMMA canister and collect a soil gas sample for TO-15 analysis?
17. **YES or NO or NA:** Was the deployment location, date/time, initial pressure, canister/flow controller identification number, sample identification number recorded on the SUMMA field form?

18. **YES or NO or NA:** Do completed SUMMA tags match information recorded on the SUMMA field form and COC?

19. **YES or NO or NA:** Was a canister retrieval appointment scheduled (< 23 hours from canister deployment time)?

20. **YES or NO:** Was a SUMMA field duplicate required? If so, was it deployed?

21. **YES or NO:** Was the correct sample identification assigned to the SUMMA sample(s)?

22. **YES or NO:** Was all applicable field documentation completed?

23. **YES or NO:** Were adequate field notes taken during the sampling event?

24. **YES or NO:** Were corrections to field notes necessary? If so, were corrections completed correctly (i.e., single-line through the error, initialed, and dated)?

25. **YES or NO:** Were the HAPSITE and SUMMA Field Forms completed properly?

26. **YES or NO:** Was the laboratory COC completed properly?

I, Dan Bingham, certify that this quality assurance checklist was reviewed and completed and that all field forms herein referenced were completed and reviewed at the end of the sampling event conducted on 3/31/17.

   floor drain, floor cracks, concrete slab cut out (laundry)
9. **YES or NO or NA:** If no interior background source(s) was identified, was a 24-hr SUMMA canister deployed in the lowest livable space within the structure?
10. **YES or NO or NA:** Was the deployment location, date/time, initial pressure, canister/flow controller identification number, sample identification number recorded on the SUMMA field form?
11. **YES or NO or NA:** Do completed SUMMA tags match information recorded on the SUMMA field form and COC?
12. **YES or NO or NA:** Was a canister retrieval appointment scheduled (< 23 hours from canister deployment time)?
13. **YES or NO:** Was a SUMMA field duplicate required? If so, was it deployed?
14. **YES or NO:** Was the correct sample identification assigned to the SUMMA sample(s)?

3/17/17

15. **YES or NO:** Was all applicable field documentation completed?

16. **YES or NO:** Were adequate field notes taken during the sampling event?

17. **YES or NO:** Were corrections to field notes necessary? If so, were corrections completed correctly (i.e., single-line through the error, initialed, and dated)?

18. **YES or NO:** Were the HAPSITE and SUMMA Field Forms completed properly?

19. **YES or NO:** Was the laboratory COC completed properly?

FULL VI PROTOCOL SAMPLING CHECKLIST

1. **YES or NO:** Signed access agreement has been obtained?
2. **YES or NO:** Reviewed completed residential questionnaire?
3. **YES or NO:** Were all underground utilities marked by Blue Stake and/or 3rd Party Utility locate?
4. **YES or NO:** HAPSITE was operated by KD Analytical-trained personnel?
5. **YES or NO:** All levels of structure have had at least one indoor air sampled analyzed with the HAPSITE?
6. **YES or NO:** If interior background source(s) was identified, was its location and product name recorded in the field log book? Identified during -5 pressure step
7. **YES or NO or NA:** If interior background source(s) was identified, was the structure owner informed of the product and was its removal requested and granted?
8. **YES or NO:** Was the structure's air volume calculated?
9. **YES or NO:** Were all combustible appliances turned off prior to beginning pressure cycling?
10. **YES or NO:** Were all target differential pressures achieved during pressure cycling (both negative and positive)?
11. **YES or NO:** Were 2.5 air volume exchanges achieved during pressure cycling (both negative and positive)?
12. **YES or NO:** Were any vapor intrusion entry points identified within the structure? If so, was the location(s) recorded in the field log book along with a description?
    floor drain, floor cracks, slab cut out in laundry room
13. **YES or NO:** Was the required soil gas sample collected at approximately 6-inches below the basement slab grade? 20" + 59" bgs
14. **YES or NO:** Were any indoor air RALs exceeded? If so, were the Project Manager and VA informed of the exceedance? Measurement at floor drain (not in breathing space)
15. **YES or NO:** Were any indoor air RSLs exceeded? If so, were the Project Manager and VA informed of the exceedance? Measurement at floor drain (not in breathing space)
16. **YES or NO:** If an indoor air RSL was exceeded, was a future appointment scheduled to deploy a 24-hr SUMMA canister and collect a soil gas sample for TO-15 analysis?
    TO be discussed w/ PM
17. **YES or NO or NA:** Was the deployment location, date/time, initial pressure, canister/flow controller identification number, sample identification number recorded on the SUMMA field form?

18. **YES or NO or NA:** Do completed SUMMA tags match information recorded on the SUMMA field form and COC?
19. **YES or NO or NA:** Was a canister retrieval appointment scheduled (< 23 hours from canister deployment time)?
20. **YES or NO:** Was a SUMMA field duplicate required? If so, was it deployed?
21. **YES or NO:** Was the correct sample identification assigned to the SUMMA sample(s)?
22. **YES or NO:** Was all applicable field documentation completed?
23. **YES or NO:** Were adequate field notes taken during the sampling event?
24. **YES or NO:** Were corrections to field notes necessary? If so, were corrections completed correctly (i.e., single-line through the error, initialed, and dated)?
25. **YES or NO:** Were the HAPSITE and SUMMA Field Forms completed properly?
26. **YES or NO:** Was the laboratory COC completed properly?

NA

I, Rachel Adams, certify that this quality assurance checklist was reviewed and completed and that all field forms herein referenced were completed and reviewed at the end of the sampling event conducted on 3/17/17.

LOCATION/RESIDENCE: 00610 H QA 3/13/17

Circle correct response for all items:

PROTOCOL: **LIMITED** (FULL)

PRE-FIELD/LAB SUPPLIES

YES or NO or NA: Individually certified-clean SUMMA canister(s) and flow controller(s) on-hand (if needed)? Arriving today

HAPSITE CALIBRATION

YES or NO: HAPSITE was calibrated by KD Analytical-trained personnel prior to initiation of sampling event?

YES or NO: Five-point HAPSITE calibration met quality assurance criteria for all target analytes (cis-DCE, TCE, PCE) and was recorded on the HAPSITE field form (relative standard deviation (RSD) < 20%, RSD of response factor < 30%, and curve fit R-squared ≥ 0.98)?

YES or NO: If HAPSITE not calibrated on date of form completion, was a calibration verification sample (NA) analyzed using a known concentration calibration gas and was the relative percent difference (RPD) for all target analytes ≥ 70% or ≤ 130 %.

YES or NO: Was continuing calibration verification standard run at end of the daily sampling event?
All analytes passed

FIELD DOCUMENTATION

YES or NO: All required field documentation on-site (field log book, HAPSITE Field Form, Pressure Cycling Field Form, SUMMA Field Form, Analytical Laboratory Chain of Custody [COC], Minor Field Modification #18)?

1. **YES or NO:** Signed access agreement has been obtained?
2. **YES or NO:** Reviewed completed residential questionnaire?
3. **YES or NO:** Were all underground utilities marked by Blue Stake and/or 3rd Party Utility locate?
4. **YES or NO:** HAPSITE was operated by KD Analytical-trained personnel?
5. **YES or NO:** All levels of structure have had at least one indoor air sampled analyzed with the HAPSITE?
6. **YES or NO:** If interior background source(s) was identified, was its location and product name recorded in the field log book?
7. **YES or NO or NA:** If interior background source(s) was identified, was the structure owner informed of the product and was its removal requested and granted?
8. **YES or NO:** Was the structure's air volume calculated?
9. **YES or NO:** Were all combustible appliances turned off prior to beginning pressure cycling?
10. **YES or NO:** Were all target differential pressures achieved during pressure cycling (both negative and positive)?
11. **YES or NO:** Were 2.5 air volume exchanges achieved during pressure cycling (both negative and positive)? 1.5 air exchanges for 15 pressure step due to time constraints (resident requested removal by 1700)
12. **YES or NO:** Were any vapor intrusion entry points identified within the structure? If so, was the location(s) recorded in the field log book along with a description?
13. **YES or NO:** Was the required soil gas sample collected at approximately 6-inches below the basement slab grade? Basement slab is 6.5 ft bgs Sampled @ 7.5 inches bgs
14. **YES or NO:** Were any indoor air RALs exceeded? If so, were the Project Manager and VA informed of the exceedance?
15. **YES or NO:** Were any indoor air RSLs exceeded? If so, were the Project Manager and VA informed of the exceedance?
16. **YES or NO:** If an indoor air RSL was exceeded, was a future appointment scheduled to deploy a 24-hr SUMMA canister and collect a soil gas sample for TO-15 analysis? (NA)
17. **YES or NO or NA:** Was the deployment location, date/time, initial pressure, canister/flow controller identification number, sample Identification number recorded on the SUMMA field form?

18. **YES or NO or NA:** Do completed SUMMA tags match information recorded on the SUMMA field form and COC?

19. **YES or NO or NA:** Was a canister retrieval appointment scheduled (< 23 hours from canister deployment time)?

20. **YES or NO:** Was a SUMMA field duplicate required? If so, was it deployed?

21. **YES or NO:** Was the correct sample identification assigned to the SUMMA sample(s)?

22. **YES or NO:** Was all applicable field documentation completed?

23. **YES or NO:** Were adequate field notes taken during the sampling event?

24. **YES or NO:** Were corrections to field notes necessary? If so, were corrections completed correctly (i.e., single-line through the error, initialed, and dated)?

25. **YES or NO:** Were the HAPSITE and SUMMA Field Forms completed properly? pa 3/21/17

26. **YES or NO:** Was the laboratory COC completed properly?

I, [signature], certify that this quality assurance checklist was reviewed and completed and that all field forms herein referenced were completed and reviewed at the end of the sampling event conducted on 3/21/17.

VAPOR INTRUSION INVESTIGATION
QUALITY ASSURANCE CHECKLIST

PROJECT:
700 SOUTH 1600 EAST PCE PLUME AOU-1:
East Side Springs
Contract No: W912DQ-15-D-3014
Order No: Task Order 5

DATE: 4/13 – 4/14/17

PERSONNEL PRESENT:

Name	Position	Company/Government
Quin Bingham	Env. Eng.	CH2M
Lynne Welsh	HA PM	HA

LOCATION/RESIDENCE: 0064

Circle correct response for all items:

PROTOCOL: LIMITED FULL

PRE-FIELD/LAB SUPPLIES

YES or NO or NA: Individually certified-clean SUMMA canister(s) and flow controller(s) on-hand (if needed)?

HAPSITE CALIBRATION

YES or NO: HAPSITE was calibrated by KD Analytical-trained personnel prior to initiation of sampling event? Calibration date 4/5/17

YES or NO: Five-point HAPSITE calibration met quality assurance criteria for all target analytes (cis-DCE, TCE, PCE) and was recorded on the HAPSITE field form (relative standard deviation (RSD) < 20%, RSD of response factor < 30%, and curve fit R-squared ≥ 0.98)?

YES or NO: If HAPSITE not calibrated on date of form completion, was a calibration verification sample analyzed using a known concentration calibration gas and was the relative percent difference (RPD) for all target analytes ≥ 70% or ≤ 130 %.

YES or NO: Was continuing calibration verification standard run at end of the daily sampling event?

FIELD DOCUMENTATION

YES or NO: All required field documentation on site (field log book, HAPSITE Field Form, Pressure Cycling Field Form, SUMMA Field Form, Analytical Laboratory Chain of Custody [COC], Minor Field Modification #18)?

LIMITED VI PROTOCOL SAMPLING CHECKLIST

1. **YES or NO:** Signed access agreement has been obtained?
2. **YES or NO:** Reviewed completed residential questionnaire?
3. **YES or NO:** HAPSITE was operated by KD Analytical-trained personnel?
4. **YES or NO:** All levels of structure have had at least one indoor air sample analyzed with the HAPSITE? one level w/ crawl space
5. **YES or NO:** If interior background source(s) was identified, was its location and product name recorded in the field log book? (NA)
6. **YES or NO or NA:** If interior background source(s) was identified, was the structure owner informed of the product and was its removal requested and granted?
7. **YES or NO or NA:** If interior background source(s) was identified, was a future appointment to deploy a 24-hr SUMMA canister scheduled no sooner than 72 hours after HAPSITE identification and removal of the interior background source?
8. **YES or NO:** Were any vapor intrusion entry points identified within the structure? If so, was the location(s) recorded in the field log book along with a description? However, resident mentioned daylighting ground water in crawlspace
9. **YES or NO or NA:** If no interior background source(s) was identified, was a 24-hr SUMMA canister deployed in the lowest livable space within the structure?
10. **YES or NO or NA:** Was the deployment location, date/time, initial pressure, canister/flow controller identification number, sample identification number recorded on the SUMMA field form?
11. **YES or NO or NA:** Do completed SUMMA tags match information recorded on the SUMMA field form and COC?
12. **YES or NO or NA:** Was a canister retrieval appointment scheduled (< 23 hours from canister deployment time)?
13. **YES or NO:** Was a SUMMA field duplicate required? If so, was it deployed?
14. **YES or NO:** Was the correct sample identification assigned to the SUMMA sample(s)?

15. **YES or NO:** Was all applicable field documentation completed?

16. **YES or NO:** Were adequate field notes taken during the sampling event?

17. **YES or NO:** Were corrections to field notes necessary? If so, were corrections completed correctly (i.e., single-line through the error, initialed, and dated)?

18. **YES or NO:** Were the HAPSITE and SUMMA Field Forms completed properly?

19. **YES or NO:** Was the laboratory COC completed properly?

FULL VI PROTOCOL SAMPLING CHECKLIST

1. **YES or NO:** Signed access agreement has been obtained?
2. **YES or NO:** Reviewed completed residential questionnaire?
3. **YES or NO:** Were all underground utilities marked by Blue Stake and/or 3rd Party Utility locate?
4. **YES or NO:** HAPSITE was operated by KD Analytical-trained personnel?
5. **YES or NO:** All levels of structure have had at least one indoor air sampled analyzed with the HAPSITE?
6. **YES or NO:** If interior background source(s) was identified, was its location and product name recorded in the field log book?
7. **YES or NO or NA:** If interior background source(s) was identified, was the structure owner informed of the product and was its removal requested and granted?
8. **YES or NO:** Was the structure's air volume calculated?
9. **YES or NO:** Were all combustible appliances turned off prior to beginning pressure cycling?
10. **YES or NO:** Were all target differential pressures achieved during pressure cycling (both negative and positive)?
11. **YES or NO:** Were 2.5 air volume exchanges achieved during pressure cycling (both negative and positive)?
12. **YES or NO:** Were any vapor intrusion entry points identified within the structure? If so, was the location(s) recorded in the field log book along with a description?
13. **YES or NO:** Was the required soil gas sample collected at approximately 6-inches below the basement slab grade?
14. **YES or NO:** Were any indoor air RALs exceeded? If so, were the Project Manager and VA informed of the exceedance?
15. **YES or NO:** Were any indoor air RSLs exceeded? If so, were the Project Manager and VA informed of the exceedance?
16. **YES or NO:** If an indoor air RSL was exceeded, was a future appointment scheduled to deploy a 24-hr SUMMA canister and collect a soil gas sample for TO-15 analysis?
17. **YES or NO or NA:** Was the deployment location, date/time, initial pressure, canister/flow controller identification number, sample identification number recorded on the SUMMA field form?

18. **YES or NO or NA:** Do completed SUMMA tags match information recorded on the SUMMA field form and COC?

19. **YES or NO or NA:** Was a canister retrieval appointment scheduled (< 23 hours from canister deployment time)?

20. **YES or NO:** Was a SUMMA field duplicate required? If so, was it deployed?

21. **YES or NO:** Was the correct sample identification assigned to the SUMMA sample(s)?

22. **YES or NO:** Was all applicable field documentation completed?

23. **YES or NO:** Were adequate field notes taken during the sampling event?

24. **YES or NO:** Were corrections to field notes necessary? If so, were corrections completed correctly (i.e., single-line through the error, initialed, and dated)?

25. **YES or NO:** Were the HAPSITE and SUMMA Field Forms completed properly?

26. **YES or NO:** Was the laboratory COC completed properly?

I, Ann Bingham, certify that this quality assurance checklist was reviewed and completed and that all field forms herein referenced were completed and reviewed at the end of the sampling event conducted on 4/13 – 4/14/17.

Appendix F
HAPSITE Data Reports

Unknown Identification Report
Date: 07/12/17 Time: 09:52:41
Calibration Method:
/Haps/Method/Analyze/Concentrator/Hill Vapor Intrusion Cal 2 min SIM.mth
Tune File:
default.tun
Method Description:
SIM cVOC Method in order of elution
cis-DCE; TCE; PCE
General Quantification Range from 0.1
ppbv to 50 ppbv

Data File: D:\AOU1\VA_HAPSITE_BACKUP\DATA\SIM_100PPB_VA_20170315\SIM_100PPB_VA_20170307_20170315_002.hps
GPS Info:
Valid GPS Information Not Available

Acquisition Date and Time: 3/15/2017 10:32:24 AM
Acquisition Method: /Haps/Method/VA /SIM_100PPB_VA_20170307.mth
Target Library: QB 04MAR2016
Last Calibrated: 3/4/2016 7:30:36 AM

Peak Search Parameters:
Search Window: 0:08.00
Window Expand Factor: 0.050
Peak Resolution: 5
Noise Level Multiplier: 2.000
Minimum Area: 5000
Minimum Width: 7
Maximum Width: 70
Minimum Fit: 0.200
Minimum Purity: 0.200

Unknown Identification Report
Date: 06/07/17 Time: 16:17:51
Calibration Method:
/Haps/Method/Analyze/Concentrator/Hill Vapor Intrusion Cal 2 min SIM.mth
Tune File:
default.tun
Method Description:
SIM cVOC Method in order of elution
cis-DCE; TCE; PCE
General Quantification Range from 0.1
ppbv to 50 ppbv

Unknown Identification Report
Date: 07/12/17 Time: 09:58:22
Calibration Method:
/Haps/Method/Analyze/Concentrator/Hill Vapor Intrusion Cal 2 min SIM.mth
Tune File:
default.tun
Method Description:
SIM cVOC Method in order of elution
cis-DCE; TCE; PCE
General Quantification Range from 0.1
ppbv to 50 ppbv
